How To Use This Book

Conventions Used in this Book

Legend of Icons

A number of icons are used in this book to highlight important information.

The PMBOK icon and call-out box refers you to where you can find a concept or term in the Project Management Institute's Project Management Body of Knowledge – The PMBOK.

The Note Icon and call-out box indicates a key fact or insight to help participants better understand helpful background information, quirks, explanations for the way things work, answers to Frequently Asked Questions (FAQs), and helpful things to remember.

The Tip, Trick and Shortcut icon and call-out box presents quick ways to do things faster and impress colleagues.

The Warning Icon and call-out box will draw your attention to important risks, pitfalls, potential issues, and alternate concepts that may assist you with managing your project processes.

The Meaning of the Fonts

This book uses a few conventions to display meaning within the text.

Bold text indicates the title of a button, menu item, or file name, that should be clicked on or selected to complete a step. Bold text also indicates a key word or phrase worthy of consideration.

Text that is set in a monospace font indicates text that needs to be typed in (like a URL, or code).

Navigating this Book

This book has been organized so that each chapter can build upon the concepts and skills learned in the previous chapters. However, each chapter is designed to be relatively self contained. Keep an eye out for any cross-references to find more information on a subject.

Chapter 1

Why Are You Here?

Chapter 2

Overview of Project Management

Chapter 3

Overview of Microsoft Project

Benefits of Scheduling Software

Project is a scheduling software used to manage projects. The software is flexible to allow for a variety of uses for different industries and different project management processes, or methodologies. The concept of scheduling is the coordination of activities, resources, money, time, and other variables that factor into completing a list of tasks containing task and resource relationships. Often scheduling involves working with limitations and date goals that are driven by the organization.

Throughout this book, you will become familiar with features available in Microsoft Project 2013. Below is a list of some of those features:

1. The ability to plan and manage a project using Work Breakdown Structure (outline) format
2. Work, duration and cost planning, forecasting and tracking
3. Flexible reporting capabilities and customization
4. Ability to integrate with Project Server/Project
5. Manual and automatic project scheduling
6. Resource management planning and forecasting
7. Budget forecasting and tracking
8. Baseline and variance reporting
9. Schedule predictability and what-if scenarios
10. Dynamic schedule management

Scheduling software has a flow of activities which compliments an overall project management process in an organization. Refer to the following steps as an example of how this might be applied.

1. The project are defined and the decision is made to perform the project
2. More indepth planning is conducted to elaborate the tasks, resources and work required to complete the project
3. The Project work will be initiated
4. Information of how the work is getting accomplished is feed back to the project manager and updated into the schedule
5. Stakeholders request a change to the project
6. Reports are produced to reflect project status and schedule
7. Steps 4-6 are repeated until the project is completed
8. When the project is completed a transition will be made to move the results of the project into ongoing business operations or business processes

9. Time is set aside to reflect on how the project was executed and opportunities for process improvement are collected.

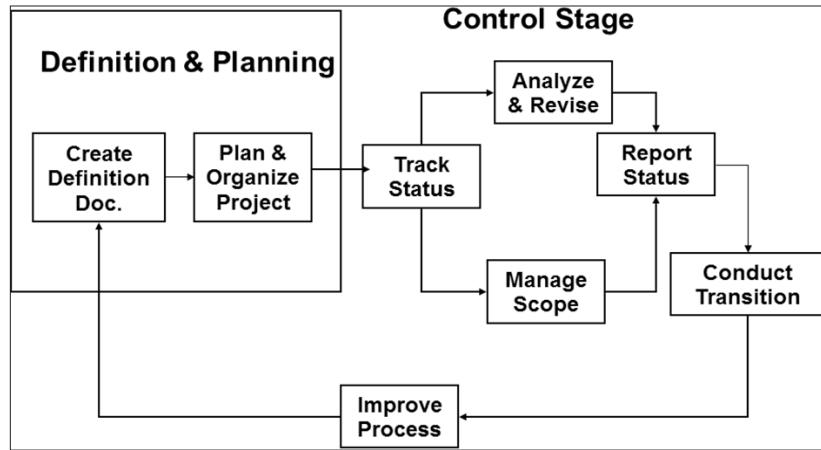

Figure 3-1 Scheduling software flow of activities

Overview of Project as a Database

Although Project may in some ways look like Excel, it is actually a very complex database. Below are some reasons to use a database:

- Eliminates the need to have information duplicated in multiple locations
- Creates a structure of information that can be organized by subject
- Creates the ability to have information related to each other
- Simplifies the ability to report on related information crossing multiple subjects

If Project was set up like a single file is in Excel, each time you assigned a resource to a task, you would have to duplicate all the details about the resource on every single task. This would create a lot of unnecessary information. In addition, every time a resource detail was changed, this would have to be duplicated on every single task. Duplicate information is a good reason to use a database structure.

By using a database structure within Project, the resource is instead connected to a task but all the details about the resource are stored in another location. This way when a report is needed, details can be pulled from multiple locations. This book is not designed to teach everything that you need to know about databases but please refer to the following chart for an example of how all of this information works together.

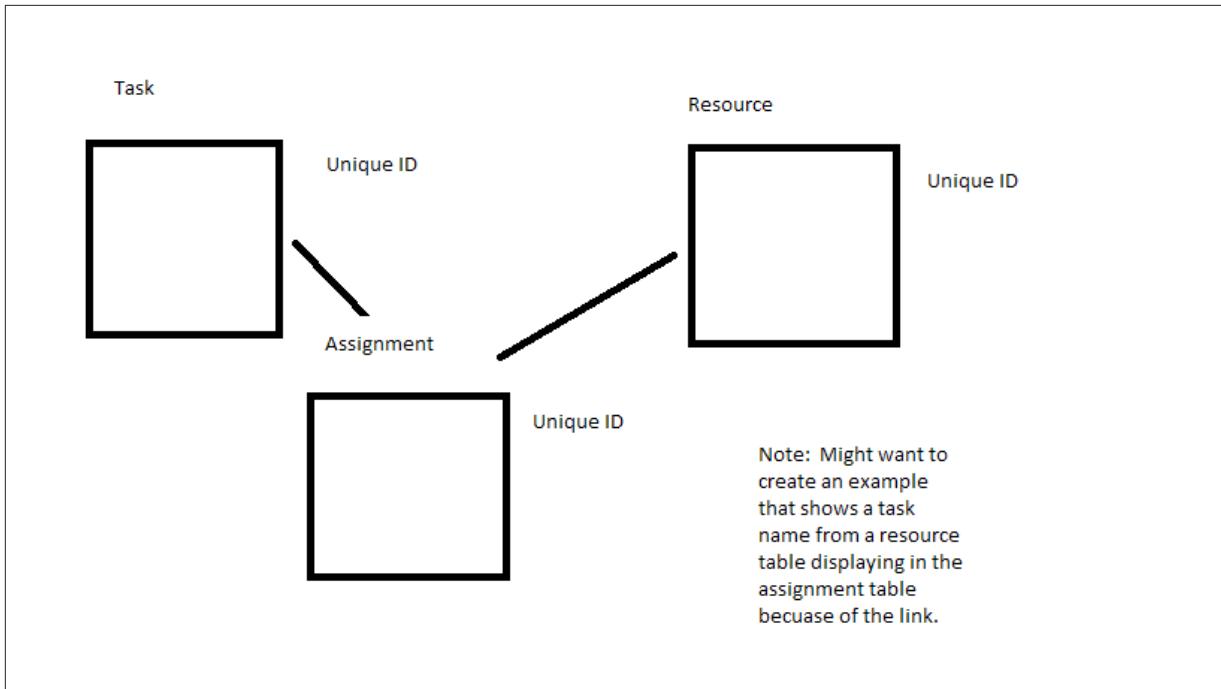

Figure 3-2 (insert chart here)

Notice that Project has three main tables of information – Task, Resource and Assignment. When a resource is assigned to a task, Project draws a connection/link between a unique resource field with a unique task field. Normally the unique field is not displayed in views, but can be added if desired.

Additional information about this database approach in Project:

- All the fields or columns of information are pre-defined when you create a project plan. Creating a plan is simply editing the information in fields/columns.
- Hiding a column in Project does not delete the information, it simply removes it from the current view
- Inserting a column is simply adding the information to a particular view
- Changing a field of information in one view is changing the information in the database and any other view that uses that field will display the change
- Some views are designed for a specific purpose and may display task information only, resource information only or some combination of task, resource, and assignment information. For example, the

Resource Sheet view does not allow you to display task names in it. That is because it is a specific view to show resource details. If you want to see how those resources are assigned, you should consider another view such as Task Usage, Resource Usage, or Gantt Chart.

This brief discussion should start you on your way to learning more about Project and how its database structure work well when managing schedules.

Project Usage

When working with information in Project, you can view data at a high-level or drill down to a detail level. Project offers timescaled views ranging from yearly all the way down to each minute. Schedulers, project managers, and other professionals using this tool will need to determine what level of information is needed to produce the desired output of information. You also need to determine how granular you want to be in maintaining that information.

For example, some organizations manage resource assignments by looking at the week as a whole and ensuring resources have 40 hours of work assigned to them. These organizations do not care if one day shows 6 hours and another day shows 12, they simply look at the total weekly hours. Other organizations drill into the daily view and ensure resources have 8 hours a day.

As you might realize, working with information drilled into the daily view will require you to manage tasks on a daily basis, while working with information on a weekly view only requires you to manage tasks on a weekly basis. This also drives the accuracy of your reports. Management of work on a daily basis gives you accurate reports for each day while management of work on a weekly basis only gives you accurate reports on a weekly basis.

When deciding your usage of project, keep in mind the following:

More Detail = More Work = More Results

Less Detail = Less Work = Less Results

Create a strategy for managing to a specific level of detail and stick with it to be most efficient in Project. For example – do not manage one task on a daily basis and another task on a weekly basis.

Formulate a Strategy

Before a project schedule is created, define what information you are hoping your schedule will return for the work and time you devote to the using the schedule. .

Set your goals for the project schedule:

1. Define the type of information your project schedule should return?
 - a. When performing home remodeling you might be interested in when to schedule the contractors.
 - b. When developing a software module you might be interested in estimating work hours of resources and costing.
 - c. When performing annual maintenance of machinery you might be interested in the timeline and the number of resources needed to accomplish the project.
2. Different projects, by nature, require different levels of detail and tracking. Decide what is right for the project you need to accomplish. The more detail the more complex the schedule will become.
3. What type of metrics (field values ie: work, cost, duration, earned value, etc) will your project management and post-project reporting require?
4. How will you track your project?
5. What are your Stakeholders status reporting expectations? Define at the column level.
6. How much work are you as a project manager willing to do to achieve desired results?

If Project Managers preplan the requirements and the outputs of the project schedule, the schedule will be more productive and result in more valid data.

Project Managers have a tendency to make the project schedule become the project. Preplanning will help project managers avoid this pitfall.

Success Checklist

Checklist to help plan a schedule more effectively:

1. **Goals:** Set the output goals of the schedule. Ask yourself: Management of the schedule is useful when I get what type of information from the schedule?
2. **Schedule:** Is the schedule a checklist of activities or is it tasks that will be managed? If it is a checklist, should it be an Excel list? If one task is late, should it change the dates for future related tasks?
3. **Reporting:** Request details of the content of status reporting required for the project from management. This will help in knowing which pieces of information you will need to focus on during schedule creation and management. It will also help set expectations for stakeholders.
4. **Data:** Gather requirements for data reports: by week? by department? by variance to baseline? etc. Some of this information will be standard in Project 2013 and some will be created using customization features.
5. **Tracking:** Are tasks required to be tracked by the number of hours worked per task or is tracking by percent complete sufficient? Defining the tracking of the project will be tied to the type of metrics that the project schedule will produce.
6. **Earned Value (EV):** if measuring EV is a requirement, more task details, estimating, baseline and tracking details will be required. This will likely result in more work for the project manager. Is help available for managing the project schedule?
7. **Resources:** What kind of reporting requirements will resources be responsible for during the project and how will the data be used. Will resource availability be updated collected and updated to the project schedule?
Defining output requirements of the schedule will in turn define the benefits of creating and maintaining the schedule. Establishing these goals will help the project manager focus on the benefits of the schedule for each specific project.

Project Desktop 2013 Overview of Versions

Microsoft offers three different versions of Project

Project Standard – This is the base scheduling software product which provides functionality that supports a majority of individuals needing a robust schedule tool. Project Standard also provides the following:

- Integration with the Office Store so you can purchase Apps for Project 2013
- Integration with SkyDrive for cloud storage of your project plan

Project Professional – The version offers the same features as Project Standard but provides these additional functions:

- Ability to inactivate tasks for various business scenarios and to support agile project management
- Lync integration (2013 or later) to support team collaboration within Project
- Visual resource management using Team Planner view
- Ability to integrate with SharePoint 2013/SharePoint Online for storing of project plans and task syncing
- Ability to connect to Project Server 2013/Project Online to support an enterprise project and portfolio management system

Project Pro for Office 365 – The version offers the same features as Project Professional but provides these additional functions:

- Delivers the software as a subscription service so it is always up to date with updates to the software being applied on a regular basis through Office 365
- Provides the ability to stream software to up to 5 devices (e.g. home PC, work PC, and tablet) using a connected Office 365 account

Internet access will be required to have access to all of the functions listed above.

For current pricing and a comparison chart of features, visit www.microsoft.com/project..

Review of the Ribbon, Back Stage, Quick Launch

Exploring the Ribbon

The Ribbon is the user interface which you will find across Microsoft products. Features are easy to find and there are new features available right at your fingertips. The series of tabs located at the top of the Ribbon represent the different sectors of work, such as resource management or task management. Starting with the Task tab, you will see it is divided into logical sections called groups. The group names are listed just below a collection of buttons. Buttons that are larger indicate a feature that is frequently used. Some of the important advantages to the Ribbon include:

- Everything is organized on tabs by subject area.
- Information on the Format tab automatically responds to the current working environment and provides “view” relevant buttons. Notice the view-specific heading above the Format tab.
- The size of the buttons adjust based on your available window or screen size so you don’t lose any capabilities, while maintaining maximum work area screen real estate.
- Features are available in a quick one- or two-click fashion.
- You can tailor the Ribbon by adding and/or removing features or by adding a new tab.

The File tab is unique and will be addressed in the next section.

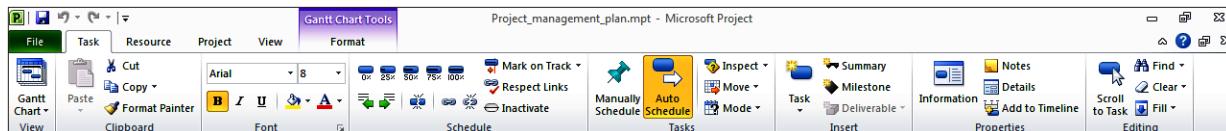

Figure 3-3 Microsoft Project 2013 Ribbon

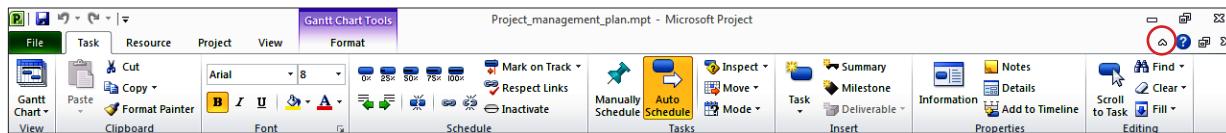

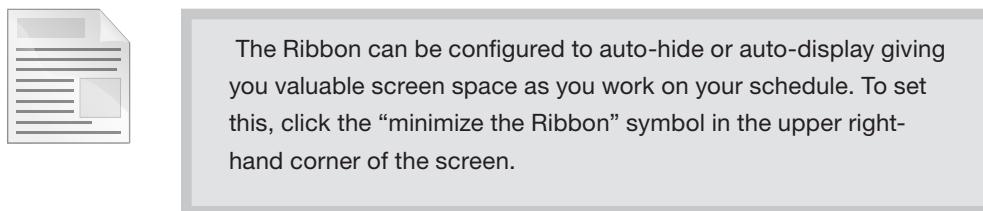

Figure 3-4 Project Ribbon – Expanded

To disable this feature, click the “Expand the Ribbon” symbol in the upper right-hand corner of the screen.

Figure 3-5 Project Ribbon – Minimized

Backstage View (File Tab)

To centrally locate file management activities, they are located on the File tab. Think of what you “do to the entire file” when you enter this area. This area is now known as the Backstage View. Some of the features available include:

- New, open, save, print, share and export.
- Connect with SharePoint , Skydrive, Office 365, and Project Server/Project Online..
- Project Options – aligning options to all new projects or only specific projects.

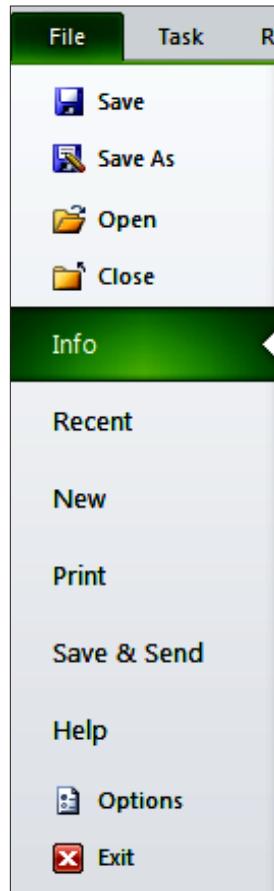

Figure 3-6 Backstage View (File Tab)

To exit Backstage View click the return arrow pointing left at the top of Backstage View.

Overview of Common Views

Project organizes views into two major categories: Task views and Resource views. A task view has a primary focus on showing task information while a resource view has a primary focus on showing resource information. Within those categories may be integrated views that showcase both task and resource information through resource assignments. This section is going to give you an introduction to common views that you should become familiar with to be successful in managing projects.

Task Views

Task views are accessed in a number of ways including through various tabs on the ribbon, through right-click short-cuts and through the view bar. You should find the option that you prefer.

Project lists 11 popular task views: Calendar, Detail Gantt, Gantt Chart, Gantt with Timeline, Milestone Rollup, Network Diagram, Task Form, Task Sheet, Task Usage, Timeline, Timeline, and Tracking Gantt. Some of these will be illustrated below.

To display a task view:

1. Click **Task** tab.
2. Click the drop-down arrow on **Gantt Chart** in the View group.
3. Click the desired view.

Figure 3-7 PLACEHOLDER

Gantt Chart – the Gantt Chart is a graphic representation of the start and finish dates for a task. In addition to graphic bars, relationship arrows are also displayed. The advantage of the Gantt chart is it includes an Entry table on the left for easy data entry and it shows a graphical model on the

right of the proposed plan for your project. This is the most popular view in Project.

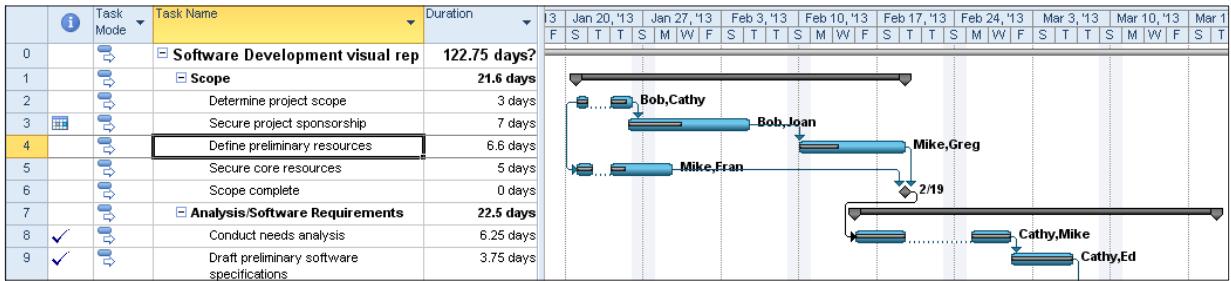

Figure 3-8 PLACEHOLDER

Tracking Gantt – this view will graphically represent the start and finish dates of a task like the Gantt Chart but is designed to help during the tracking phase of the project schedule. The advantage of this view is the variance between the baseline plan and the current plan are show visually.

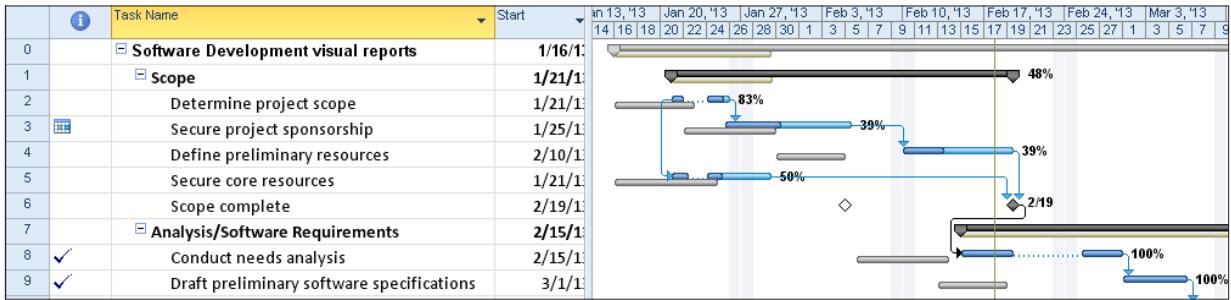

Figure 3-9 PLACEHOLDER

Network Diagram – The Network diagram is designed as a precedence diagram. It shows the predecessors and successors of tasks without regard to timeframe. This view is useful to see the layout of your schedule to and easily follow links.

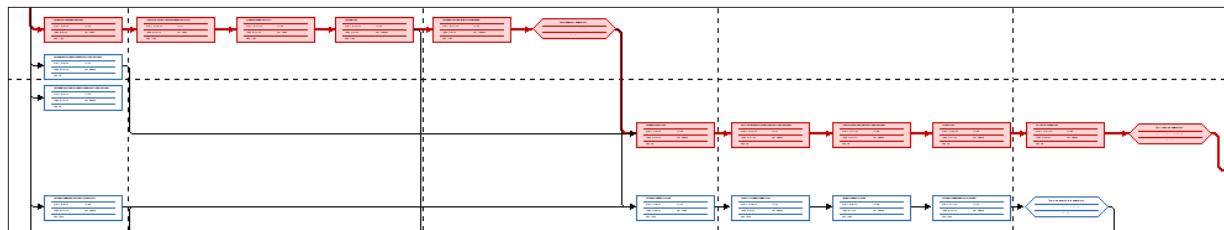

Figure 3-10 PLACEHOLDER

Calendar view – The calendar view shows the project schedule in a calendar layout. This format is useful when presenting to individuals not familiar with how to read a Gantt Chart view.

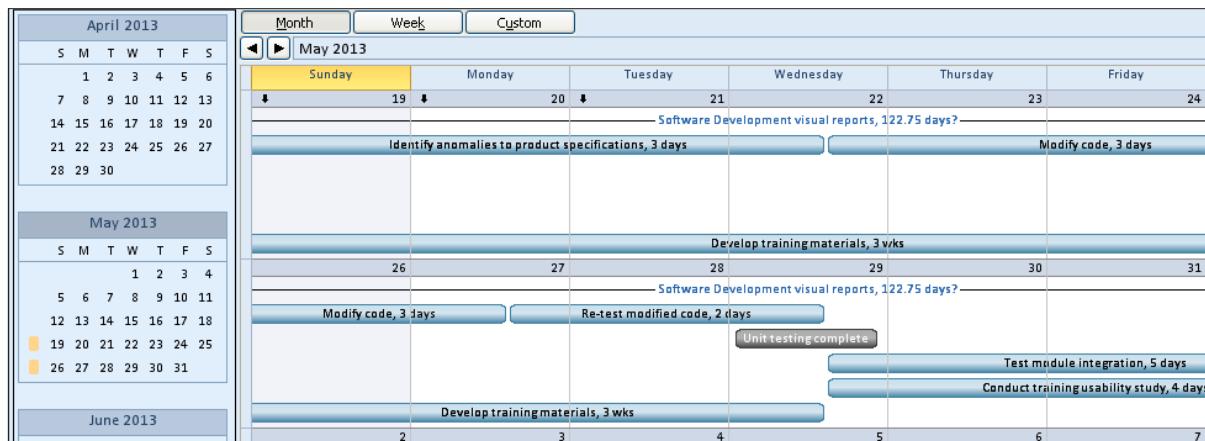

Figure 3-11 PLACEHOLDER

Timeline View – The Timeline View is a very flexible and customizable view. Tasks may be selected to appear on the timeline to give high level reporting capability. In addition, the timeline has the ability to highlight the timeframe it is representing. The Timeline view will be discussed in Chapter 12, *Printing and Reporting*.

Figure 3-12 PLACEHOLDER

Task Usage – The Task Usage view shows tasks and the resources assigned to the task. The advantage of this view is it includes resource assignments and shows numerically the resource needs to complete each task. Tailoring of this view provides cost or other fields of information.

	Task Mode	Task Name	Work	Details	February 1		March 1		April 1	
					2/3	2/17	3/3	3/17	3/31	
7		Analysis/Software Requirements	236 hrs	Work	16h	100h	108h	12h		
		Conduct needs analysis		Cost	\$1,600.00	\$10,000.00	\$10,800.00	\$1,200.00		
8	✓	Mike	100 hrs	Work	16h	84h				
		Cathy		Cost	\$1,600.00	\$8,400.00				
			50 hrs	Work	8h	42h				
				Cost	\$800.00	\$4,200.00				
				Work	8h	42h				
				Cost	\$800.00	\$4,200.00				

Figure 3-13 PLACEHOLDER

Resource Views

Resource views are accessed in a number of ways including through various tabs on the ribbon, through right-click short-cuts and through the view bar. You should find the option that you prefer.

Project lists 5 popular resource views: Resource Form, Resource Graph, Resource Sheet, Resource Usage, and Task Planner. Some of these will be illustrated below.

To display a resource view:

1. Click **Task** tab.
2. Click the drop-down arrow on **Gantt Chart** in the View group.
3. Click the desired view.

Figure 3-14 PLACEHOLDER

Resource Sheet – The resource sheet provides the table where

resources are added into Project. The advantage of this view is the most popular fields needed to describe a resource are located here.

		Resource Name	Type	Material	Initials	Group	Max.	Std. Rate	Ovt. Rate	Cost/Use	Accrue	Base
1		Architecture analyst	Work		A		100%	\$0.00/hr	\$0.00/hr	\$0.00	Prorated	Standard
2		Project management	Work		P		100%	\$0.00/hr	\$0.00/hr	\$0.00	Prorated	Standard
3		Deployment resc	Work		D		100%	\$0.00/hr	\$0.00/hr	\$0.00	Prorated	Standard
4		Procurement	Work		P		100%	\$0.00/hr	\$0.00/hr	\$0.00	Prorated	Standard
5		Management	Work		M		100%	\$0.00/hr	\$0.00/hr	\$0.00	Prorated	Standard

Figure 3-15 PLACEHOLDER

Resource Graph – The Resource Graph graphically displays information about each resource. The advantage of this view is it can easily identify visually where a resource might be overallocated and by how much based on the length of the bar above the units available line.

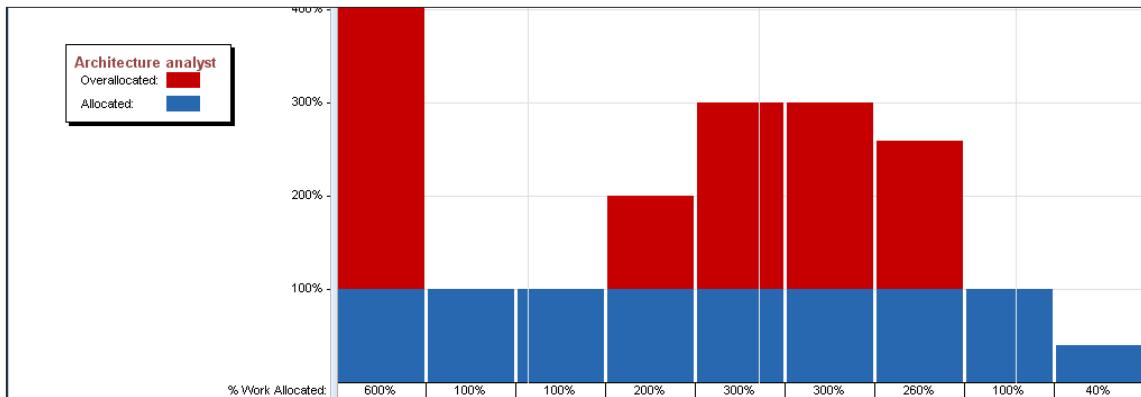

Figure 3-16 PLACEHOLDER

Team Planner – the Team Planner view is a resource focused view that showcases work assignments in a graphical timeline format. The advantage of this view is the focus is on the resource and graphically what work is scheduled at what time.

This feature is only available in Project Professional or Project Pro for Office 365.

Project management		Train deployment resources in deployment	Select team tasks and timeline	Review deployment team tasks and timeline	Deploy infrastructure components	Test infrastructure components	Request feedback	Obtain feedback	Evaluate	Determine
Deployment resources		Train deployment resources in deployment	Select team tasks and timeline	Review deployment team tasks and timeline	Deploy infrastructure components	Test infrastructure components	Request feedback	Obtain feedback	Evaluate	

Figure 3-17 PLACEHOLDER

Resource Usage— The Resource Usage view shows every resource on the project and what tasks they have been assigned. The advantage of this view is it shows hours scheduled to accomplish each task. This view is a reversal of Task Usage view. Both of these views are useful in team meetings.

3	Deployment resources	Work	40h	40h	36h	40h	40h	32h	40h	40h	40h	40h	18h
		Rem. Avail.	0h	0h	4h	0h	0h	8h	0h	0h	0h	0h	22h
	Develop detailed implementation strategy	Work	40h										
		Rem. Avail.											
	Validate implementation strategy in test environment	Work		24h									
		Rem. Avail.											
	Review implementation strategy noting other initiatives	Work			16h								
		Rem. Avail.											

Figure 3-18 PLACEHOLDER

Popular View Adjustments and Navigation

Zooming In and Out

Zooming in or out is the way to adjust the bar chart or time scale portion of a view to show more or less detail. For example, you can display Gantt bars across a daily time scale or across a quarterly time scale.

Two popular methods for zooming in and out are using the Zoom Slider and the Zoom options on the View tab. The Zoom Slider is recommended since that option is always displayed even when you navigate to another view.

- You can click the minus and plus buttons to zoom out and zoom in.
- You can drag the zoom indicator in between the zoom out and zoom in buttons.

Figure 3-19 Zoom Slider

Hide or Insert a Column

When you hide a column in Project 2013, the column is only removed from view, not deleted from your plan. Keep in mind that hiding a column doesn't remove any information from your plan.

Hide a Column

To hide a column from a sheet view:

1. In a sheet view, select the column you want to hide by clicking its title.
2. This displays the **Gantt Chart Tools** tab with the **Format** tab underneath in the Ribbon.
3. Click the **Format** tab.
4. Click the drop-down arrow on **Column Settings** in the Columns group.
5. Click **Hide Column**.

You can also press the **delete** key on your keyboard.

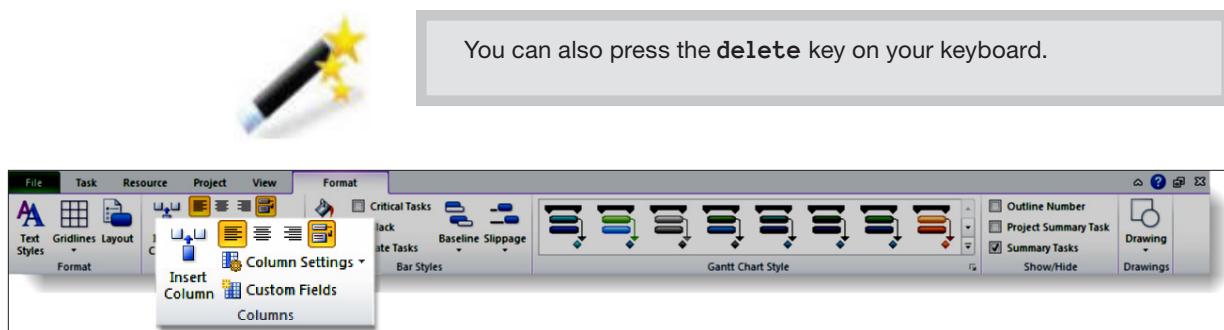

Figure 3-20 Hide or Remove Column Icons

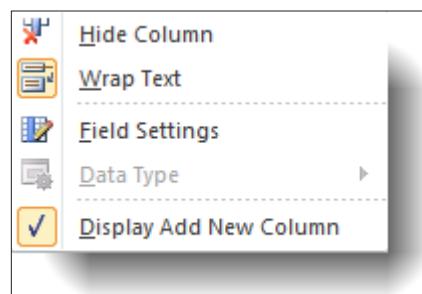

Figure 3-21 Column Settings Dropdown Menu

Insert a Column

To insert or add a column:

1. In a sheet view, select the column to the right of where you want to insert the column.
2. This displays the **Gantt Chart Tools** tab with the **Format** tab underneath in the Ribbon.
3. Click the **Format** tab.
4. Click **Insert Column** in the Columns group.
5. A new blank column is displayed to the left of the column that you had selected. Click the dropdown arrow in the title box to specify the type of information from the list of possible column types (or fields) that the column will contain.

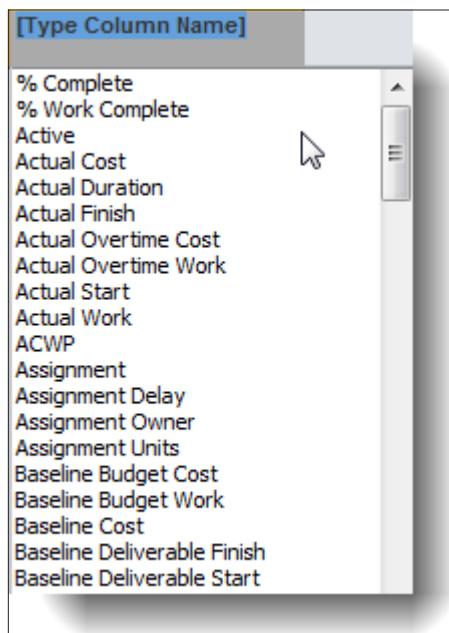

Figure 3-22 Add New Column

Also at the end of every table in a Sheet view (the far right) there is an **Add New Column** option available.

	Work	Predecessors	Resource Names	Add New Column
4	8 hrs		Project Director	
5	8 hrs 4		Project Director	
6	8 hrs 5		Project Manager	
7	8 hrs 6		Project Manager,Acceptor	
8	0 hrs 7			
9	40 hrs			
10	8 hrs 8		Project Director	
11	8 hrs 10		Application Architect,Technical	

Figure 3-23 Add New Column in View

To unhide a previously hidden column, insert the column as you would with any new column.

Using the Scroll to Task Button

The Scroll to Task is a shortcut feature to bring information to you quickly. It is useful in views like Gantt Chart, Task Usage, and Resource Usage where there is a table of information on the left and an associated timescale of information on the right. The main advantage of this feature is to reduce time spent scrolling or looking for information.

To use Scroll to Task:

1. Click the task name or row ID number.
2. Click the **Task** tab.
3. Click **Scroll to Task** in the Editing group.

Figure 3-24 Scroll to Task Icon

Project displays the date or dates where the selected task occurs on the timeline.

Go To and Find

As schedules begin to get larger, it is useful to have shortcuts to navigate through the information. In this topic, we will illustrate the advantages of Go To and Find within Gantt Chart view.

To Go To information:

1. Press the **F5** key or **Ctrl+G**.
2. In the Go To dialog box, enter a row ID number or choose or enter the date and click **OK**.

To Find information:

1. Click the **Task** tab.
2. Click **Find** in the Editing group.
3. In the **Find** dialog box, enter or set the desired options and click **Find Next**.

Keyboard Shortcuts

Key Tips allow you to use your keyboard to navigate through the Quick Access Toolbar and the Ribbon. To turn on Key Tips, simply tap the Alt key. You can also press F10 twice. Follow the letters and numbers that are displayed to use the function you desire.

You can also use keyboard shortcuts to navigate through your project. The following table lists keys that are useful when navigating within views and windows.

Table 3.1 Key Tips and Keyboard Shortcuts

Key Tips & Shortcut	Outcome
Tab	Move right one field in an Entry table or dialog box.
Shift+Tab	Moves left one field in an Entry table or dialog box.
Home	Moves to the beginning of a row or field of information.
End	Moves to the end of a row or field of information.
Page Up	Moves up one screen.
Page Down	Moves down one screen.
Alt + Page Up / Alt + Page Down	Moves left or right one screen on the time scale.
Alt + ⇡ / Alt + ⇢	Moves the time scale one unit left or right (as defined by the bottom time scale tier).

Table 3.1 Key Tips and Keyboard Shortcuts

Key Tips & Shortcut	Outcome
Alt + Home	Moves to the project start date in the bar chart.
Alt + End	Moves to the project finish date in the bar chart.
Ctrl + Home	Moves to the first field in the first row of the Entry table or the same location in any other sheet view.
Ctrl + End, Home	Moves to the first field in the last row of the Entry table or the same location in any other sheet view.
Ctrl + ↑	Moves to the First Row.
Ctrl + ↓	Moves to the Last Row.
F1	Turns on Project Help.
F2	Activates in-cell editing for the selected field.
F3	Displays all tasks or resources when a prior filter was applied.
F5	Goes to a specific row ID number or a date on the time scale.
F6	Activates the other pane in a combination or dual-pane view.
F10	Press twice to turns on Key Tips. You can also tap the Alt key.

Table 3.1 Key Tips and Keyboard Shortcuts

Key Tips & Shortcut	Outcome
Ctrl + Shift + F5	Displays the Gantt bar for the selected task.
Ctrl + F4	Closes the Project window.
Ctrl + F5	Changes the Gantt Chart view from maximized to previous size (i.e., view window is separated from Project window).
Ctrl + F10	Maximizes the Gantt Chart view and combines it with the Project window.
Ctrl + F9	Allows you to turn on and off Auto Calculate.
Ctrl + F6	Displays the next open Project window.
Ctrl + Shift + F6	Displays the previous open Project window.
Alt + Spacebar / Alt + Hyphen	Displays the application control menu.
Insert	When the Task ID is selected, a new blank row is added in the Entry table.
Delete	When the Task ID is selected, a row is deleted from the Entry table.
Alt + F3	Displays the Field Settings dialog box for the active column.
Alt + F4	Closes Project.

Table 3.1 Key Tips and Keyboard Shortcuts

Key Tips & Shortcut	Outcome
Shift + F2	Displays Task Information in Gantt Chart view. Displays Resource Information in Resource Sheet view.
Shift + F3	Sorts by ID number.
Shift + F6	Enables the horizontal and vertical split bars in Gantt Chart view.
Shift + F11 / Alt + Shift + F1	Creates a new version of your schedule (e.g., Project: 2).

Help

Within Project, there are easy options to get help on features and functions. The default setting of the Ribbon provides detailed feature descriptions when you pause on a button. Should you need more assistance, a detailed help search is recommended.

The detailed help feature automatically assumes you are connected online, but you have the option to switch it to search on your computer only.

Navigation through help is just like a website and you will notice the home button, back button, and hyperlinks as being familiar to you.

To access Help

1. Press the **F1** key or click the help icon in the top right-corner (question mark).
2. Click the drop-down arrow on **Project Help** and choose the desired help option (online or not).
3. Enter the terms you want to search on in the text box and press the **Enter** key or magnifier icon

Chapter 4

Start a Project

Creating New Projects

One of the very first things you need to do to create a project is to choose an approach.

There are several methods to select from when creating a new schedule using Microsoft Project 2013. You may start a project schedule with a blank template or use an existing template. If you have a task list started in Excel, Outlook, Word and SharePoint, these task lists may be added to a new project schedule. Below are listed some of the suggested methods for initiating a new project schedule.

- Blank – clean schedule
- New From Existing – copy from existing schedule
- New From Excel – importing information from Excel
- New From SharePoint Tasks List – shortcut to bring SharePoint tasks into your schedule
- Get Started Wizard – guided approach with visuals to help individuals feel more comfortable working in a schedule
- Template – public or private pre-built schedules that can be used as examples

If you do not have Internet access, you may not have all of these choices. Many templates are available from the Microsoft site and are not included with the software when installed.

Office 365 or cloud users may have different choices depending on their organization's configuration.

How to Start a New Project Schedule

1. Click the File tab
2. Click **New**
3. Click the desired item from the previews
4. If needed, click **Create** to obtain a copy of that item to start your schedule

Templates available are simply examples and may not map to your organization's project management practices. Be sure to review the templates for modifications that you might need to make.

Saving a project

Saving a project is all about storing a project for quick and easy retrieval. You may choose to store your project on your computer, on a network location, or on a cloud storage solution. As each organization's configuration is different, we will focus on the procedures for saving to your local computer.

How to Save a New Project

1. Click the **File** tab
2. Click **Save** or **Save As**
3. Click **Computer**
4. Click **Browse**
5. Navigate to the desired folder
6. Enter the desired name for the schedule
7. Click **Save**

The folder you just used will be available under Recent Folders to simplify this process for future new projects.

When making changes to the same project, you can use the Save icon on the Quick Access Toolbar as a fast method to ensure your project changes are being captured.

Save or Save As, Share and Export

Save As

Table 4.1 PLACEHOLDER

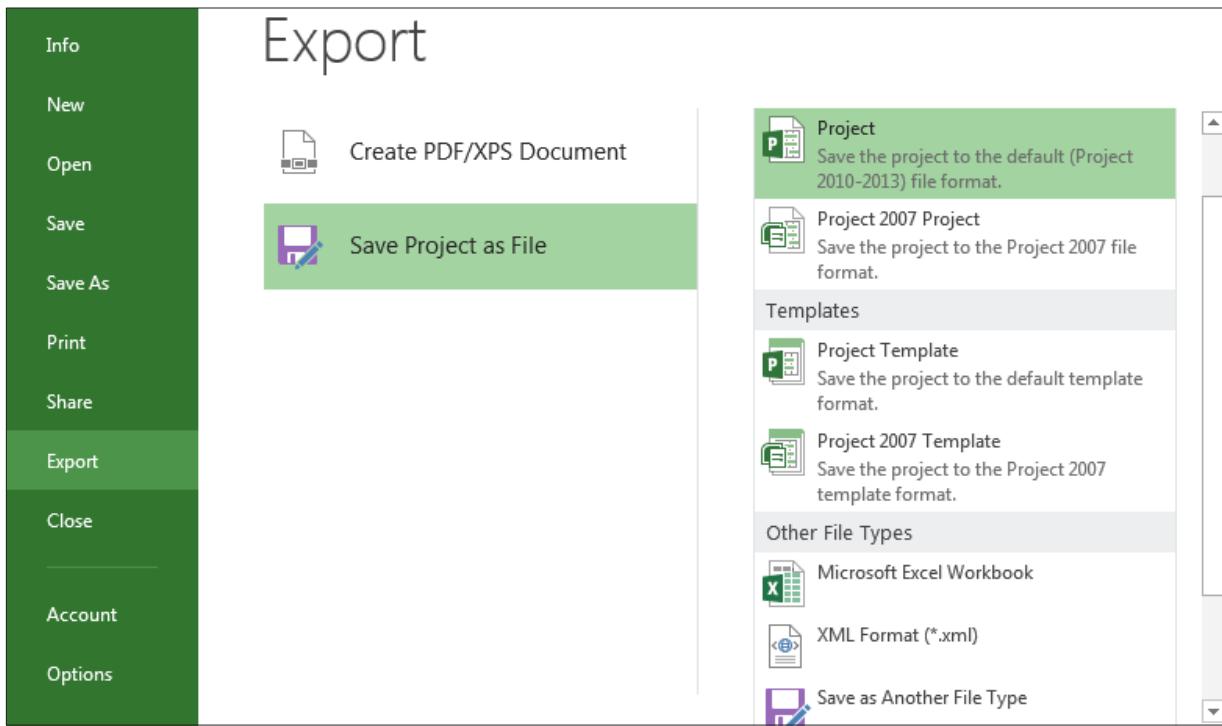

Share Option	Feature
Sync with Sharepoint Site	Save file to an existing Sharepoint site
Email	Will send the currently opened MS Project file as an attachment in an email

Table 4.2 PLACEHOLDER

Export	Feature
Create PDF/XPS Document	Using the current view a PDF of the view will be created and saved to disk

Table 4.2 PLACEHOLDER

Export	Feature
Save Project as File	<p>This feature will allow for:</p> <ul style="list-style-type: none"> • Saving into earlier version formats of MS Project files • Saving templates • Saving data to Excel, XML or another type format. This option will also start the MS Project Export Wizard where data for exporting maybe selected.

**Figure 4-1 Export Project screenshot**

To email the current open file as an attachment in an email:

- Click on File → Share → Email → Send as Attachment

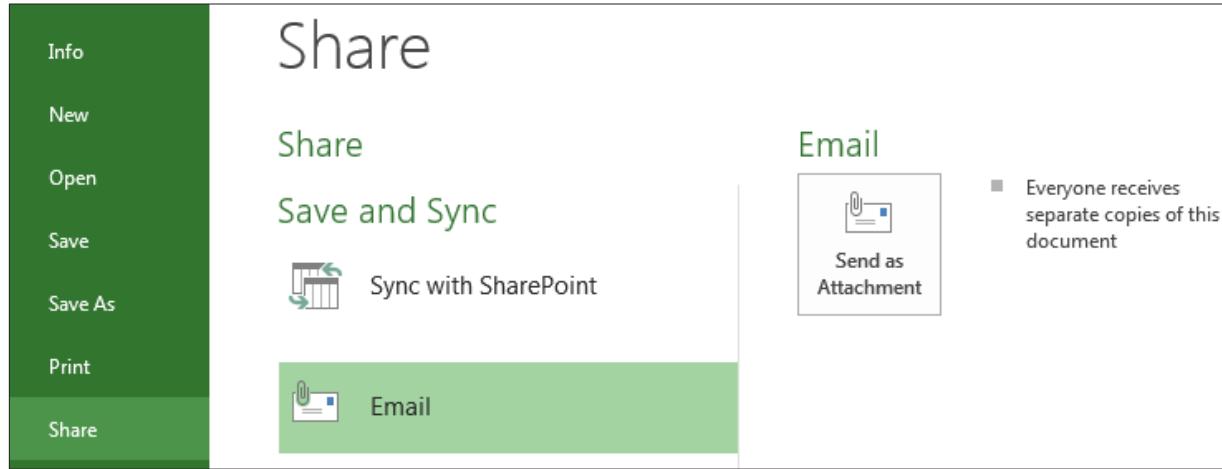

Figure 4-2 Share Email screenshot

Ms Outlook will open with the file as an attachment. Select the email address, complete the email information and click **Send**.

Opening a Project

Since opening projects is such a frequent task, you should take advantage of quick methods to do this. The following steps will help you optimize your environment for speedy retrieval of projects.

How to Open a Project

1. Click the **File** tab
2. Click **Open**
3. Click **Computer**
4. Click **Browse**
5. Navigate to the desired folder
6. Select the name for the schedule
7. Click **Open**

Click Recent Projects to quickly retrieve a project you have previously opened.

Pin a project to the top of the recent project list if you anticipate you will be using it on a regular basis.

Adding the Open button to the Quick Launch bar will save time.

Creating a New Project

When Project 2013 is initiated, a new blank project schedule will automatically appear.

To create a blank project schedule:

- Click **File → New**

Backstage choices shown below will give you an array of choices of where to begin a new project schedule. As you click the various choices, options and additional data will appear on the right side of the view.

- Double clicking **Blank project** or click **Blank project** and click **Create** will result in creating a blank project file
- **Recent Templates:** Create a project from a recently used template

- **My templates:** Template created by you and saved to your desktop
- **New from an existing project:** Use an existing project schedule to create a new project
- **New project from Excel workbook:** Columns in the Excel workbook will be mapped to fields within Project 2013. The import process is discussed in the next lesson.
- **New from Sharepoint task list:** Project 2013 Professional only. Tasks will be imported using the URL and security of the Sharepoint site.
- **Office.com templates:** Create a new project from a template that would be downloaded from Office.com on-line

If the Quick Access Bar was customized to add the New button, pressing that button will create a new project schedule

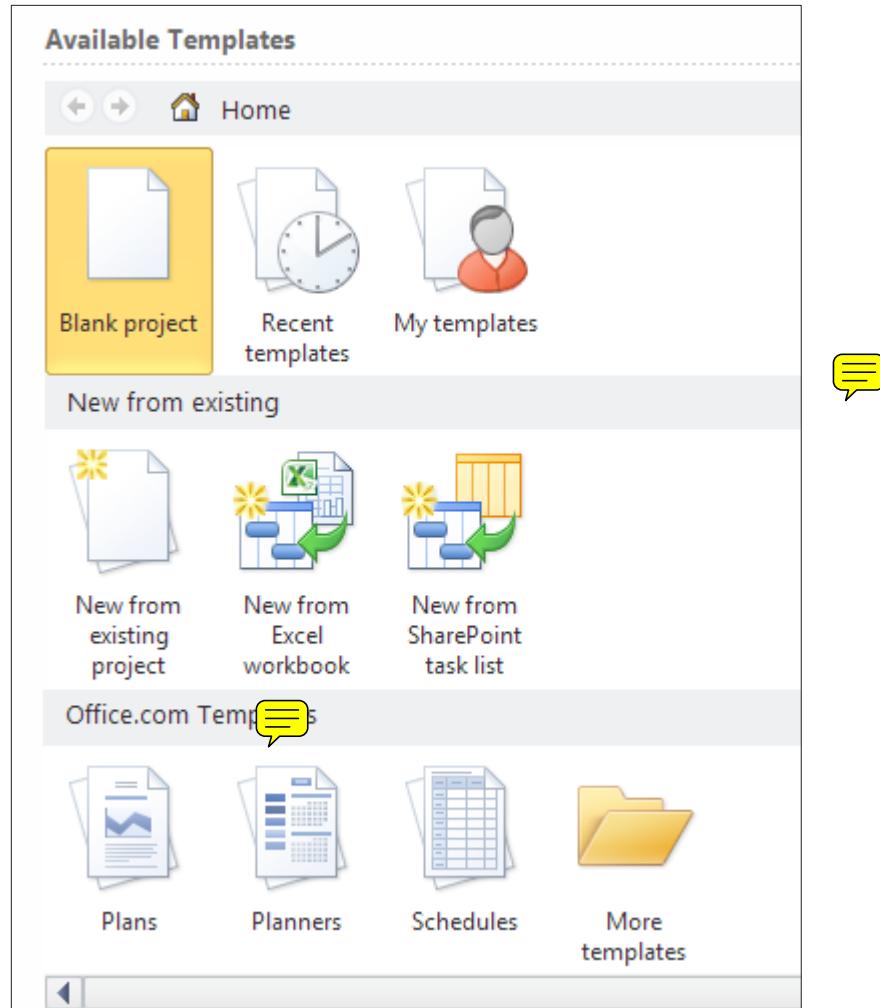

Figure 4-3 Creating a new project.

Creating a Project from an Excel Workbook

A project schedule can be created using an Excel Workbook task list. Keep in mind that the fields or columns that are being imported from Excel will be mapped to fields or columns within Project 2013. Pre-planning to know which Excel fields should be mapped to which Project 2013 fields would be helpful.

To create a project schedule from an Excel Workbook:

1. Click **File → New → New From Excel Workbook**
2. Navigate to the Excel file that contains the tasks to be imported into the schedule, click **Open**
3. Project 2013 Import Wizard will start running – Click **Next**
4. Select whether to use a new map that will be created or an existing Project import map. For this example we will create a new map. Click the radio button next the **New Map** and click **Next**
5. Import can start a new project file, append to the end of an existing project file or merge the data using a merge field. In this example we will create a new project schedule. Click **As a new project** and click **Next**.
6. When the data is brought into Project 2013, select if the data is to be mapped to the Task fields, Resource fields or Assignment fields. Click **Tasks**.
7. If the originating Excel file contains header or title information, click **Import includes Headers**. The system will remove this row (the first line only) as the header row. Click **Next**
8. The Task Mapping form will be used to view some of the data and map which Excel fields will be imported into which Project 2013 fields. Pull down the values in the **Select worksheet name** option and select the sheet name in Excel that contains the data to be imported. After the choice has been made, the data from the sheet will be available for viewing.
9. In the example below, the duration field from the Excel Workbook was able to be automatically mapped to the duration field in Project 2013. However, the Task Name field could not find a match. The correct field name for the task name field in Project 2013 is “Name”. Click the red error message (**not mapped**) and select the field name of **Name**.

Repeat for other fields to be imported. Not all fields are required during the import process which allows the user to pick and choose which ones are appropriate to the schedule. Click **Next** to continue after all columns have been mapped.

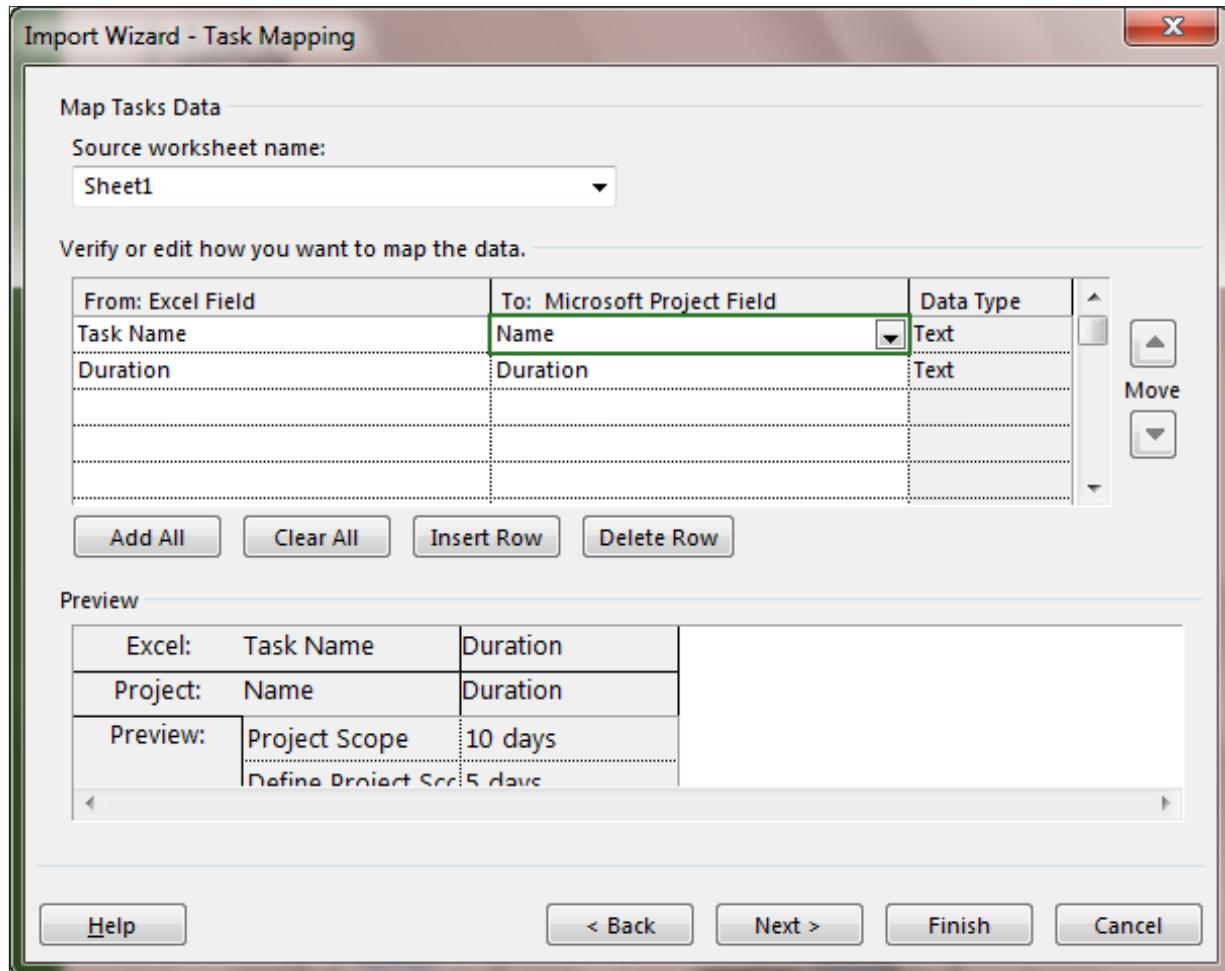

Figure 4-4 Creating a project from an Excel spreadsheet

10. The next step offers the option to save the map for future reuse.

a. To skip saving the map, click **Next**.

b. To save the map, click **Save Map** and give the map a name.

An option will be available to use the Organizer to copy the import map into the Global.mpt and save it for future use. The Organizer will be discussed in [Module 10](#).

Click **Finish** to start the import.

11. The new Project 2013 schedule will open with the columns imported.

Creating a Project from a SharePoint Task List

Project 2013 Professional allows for creating a new project by importing a task list from a SharePoint site. The user must have appropriate permissions to access the SharePoint site and the URL path to insert into the form directing Project 2013 Pro to the location of the task list.

To import tasks from a SharePoint task list into Project 2013 Professional:

1. Click **File** → **New** → **New from SharePoint Task List**

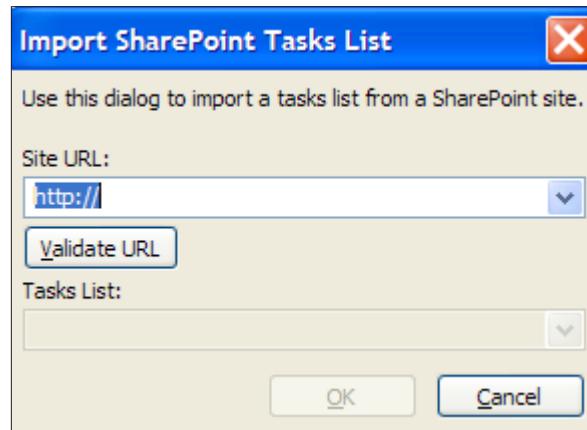

Figure 4-5 PLACEHOLDER

2. Enter the **URL** in the form as shown above and click **Change to Check Address**. A list of all the task lists included in the SharePoint site will be displayed. Select the appropriate list and click **OK**.
The list will be imported from the SharePoint site.

This feature is available in ms Project 2013 Professional version only.

Saving the Schedule

Project 2013 provides multiple file formats for a project schedule. The steps to save a file are very similar to other ms Office files.

To save the Project 2013 schedule:

1. Click **File** → **Save as** → **select file location**
2. Enter the file name in the File Name area
3. Click **Save** to complete the save. The file will be given a Project 2013 default file extension of .mpp

There is also an option to save the Project 2013 schedule in an alternative file format. Some of the formats are:

- ms Project 2007
- ms Project 2000-2003
- ms Project template 2013 - .mpt file extension
- ms Project template 2007 - .mpt file extension
- ms Excel
- PDF Files (.pdf)
- XPS Files (*.xps)
- XML Format (*.xml)
- csv (Comma delimited) (*.csv)
- Text (Tab Delimited) (.txt)
- Excel Workbook (.xlsx)
- Excel Binary Workbook (*.xlbs)
- Excel 97-2003 (.xls)

Save As

The Save As view, located in the backstage area in Project 2013, has been enhanced and provides more functionality for the user. From the backstage view these options are an easy method of saving projects to disk as well as sharing projects schedules with others users. Options have been added to sync a project with a Sharepoint site and to save a project to a Skydrive site.

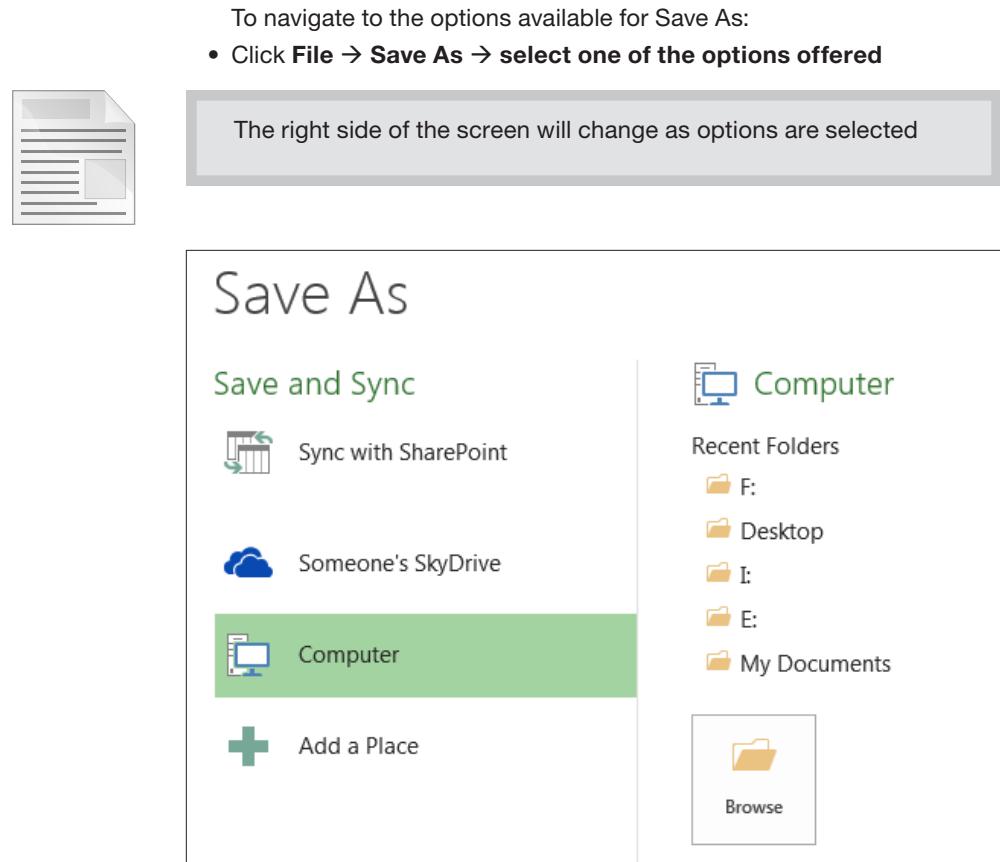

Figure 4-6 Save As

Table 4.3 PLACEHOLDER

Save or Save as Option	Features
Sync with Sharepoint Site	Save file to an existing Sharepoint site
Some's Skydrive	Save file to your Skydrive or a site you have access to

Table 4.3 PLACEHOLDER

Save or Save as Option	Features
Computer	Save file to location on a disk drive A list of recently used locations will be displayed
Add a Place	Add other locations such as Cloud or Office 365

Share & Export

Calendar Overview

Calendars in Project 2013 will determine when a task may be scheduled within the project schedule. It will also influence what defines a day, a week and a month within the project schedule. The calendars will also work hand-in-hand with the calendar options to determine when and how the tasks will be scheduled. Having the correct calendar applied to the project schedule before tasks are entered is essential for project scheduling success.

In this lesson we will explore:

1. How calendars work in Project 2013
2. How to Set Working Hours and Days
3. How to Set Non-Working Hours and Days
4. How to Set Calendar Options

How Calendars Work in Project 2013?

There are several types of calendars within the Project 2013 system. The following are definitions of available calendars:

- **Project Calendar:** The project calendar is the calendar assigned to a project and it defines the project working and non-working days. The default name for the Project Calendar is “Standard”.
- **Resource Calendar:** Each resource will have its own calendar which may be based off of a base calendar or the project calendar. Unique resource calendars may also be created.
- **Task Calendar:** A task calendar is assigned to a task to allow for the scheduling of that task in a unique timeframe. For example: tasks which have to occur on a weekend.

How the calendars are used by the software:

A task will be scheduled based on the Project calendar until a resource is assigned to the task. At that time, the Resource calendar will control the scheduling of the tasks. Unless – there is a task calendar assigned to a task which will override the Project calendar and the Resource calendars.

When a project schedule is created, a default calendar of “Standard” is applied to the schedule. This is called the Project Calendar for the project. The default values on the Standard calendar are: Monday through Friday which are working days, and working time is 8:00 am to 12:00 pm and 1:00 pm to 5:00 pm daily. No holidays are indicated on the calendar. The Standard calendar is also the calendar that will be viewed in the background of the Gantt Chart views. The Calendar Options work hand in hand with the Project Calendar to determine number of hours in a day or week and these values should be in sync with one another. The Calendar options will be discussed in the next section.

By default, 2 additional calendars are included with ms Project 2013: a 24 hour calendar and a Night Shift calendar. Either of these may be used as Project, Resource or Task calendars.

FAQ's

Q: Why are there no holidays on the calendars?

A: This is an international program. Holidays vary from country to country.

Q: Is there the ability to add holidays to a calendar the way they can be added in Outlook?

A: No – this is not a capability of the software.

Q: Do I have to recreate the calendar for each project?

A: No – calendars may be created and saved through the Organizer to use in future projects. The Organizer will be covered later in this chapter.

The default calendar name for the system is “Standard”. If a different calendar name is selected, each Gantt view will also require changing because the calendar which is viewed Gantt Chart views are set to display the Standard calendar. This change can be made by right clicking in the Gantt view and select Non-working time and changing to the calendar to be seen in the view. Most users keep the Standard calendar because of ease of use.

Setting Working Hours and Days

After the project file has been created, decide what the working days (business days) of the project schedule will be. Decide also, how many hours will make up a working day and what times the hours will be. By default, the working days of the calendar are Monday through Friday and the working time is 8:00 am to 12:00 pm and 1:00 pm to 5:00 pm daily or 8 hours working per day.

To Change the Working Hours of all Days on a Calendar:

1. Click **Project → Change Working Time**
2. Check to ensure the calendar you wish to change is displayed in the **For calendar** list
3. Click **Work Weeks** near the bottom of the dialogue box

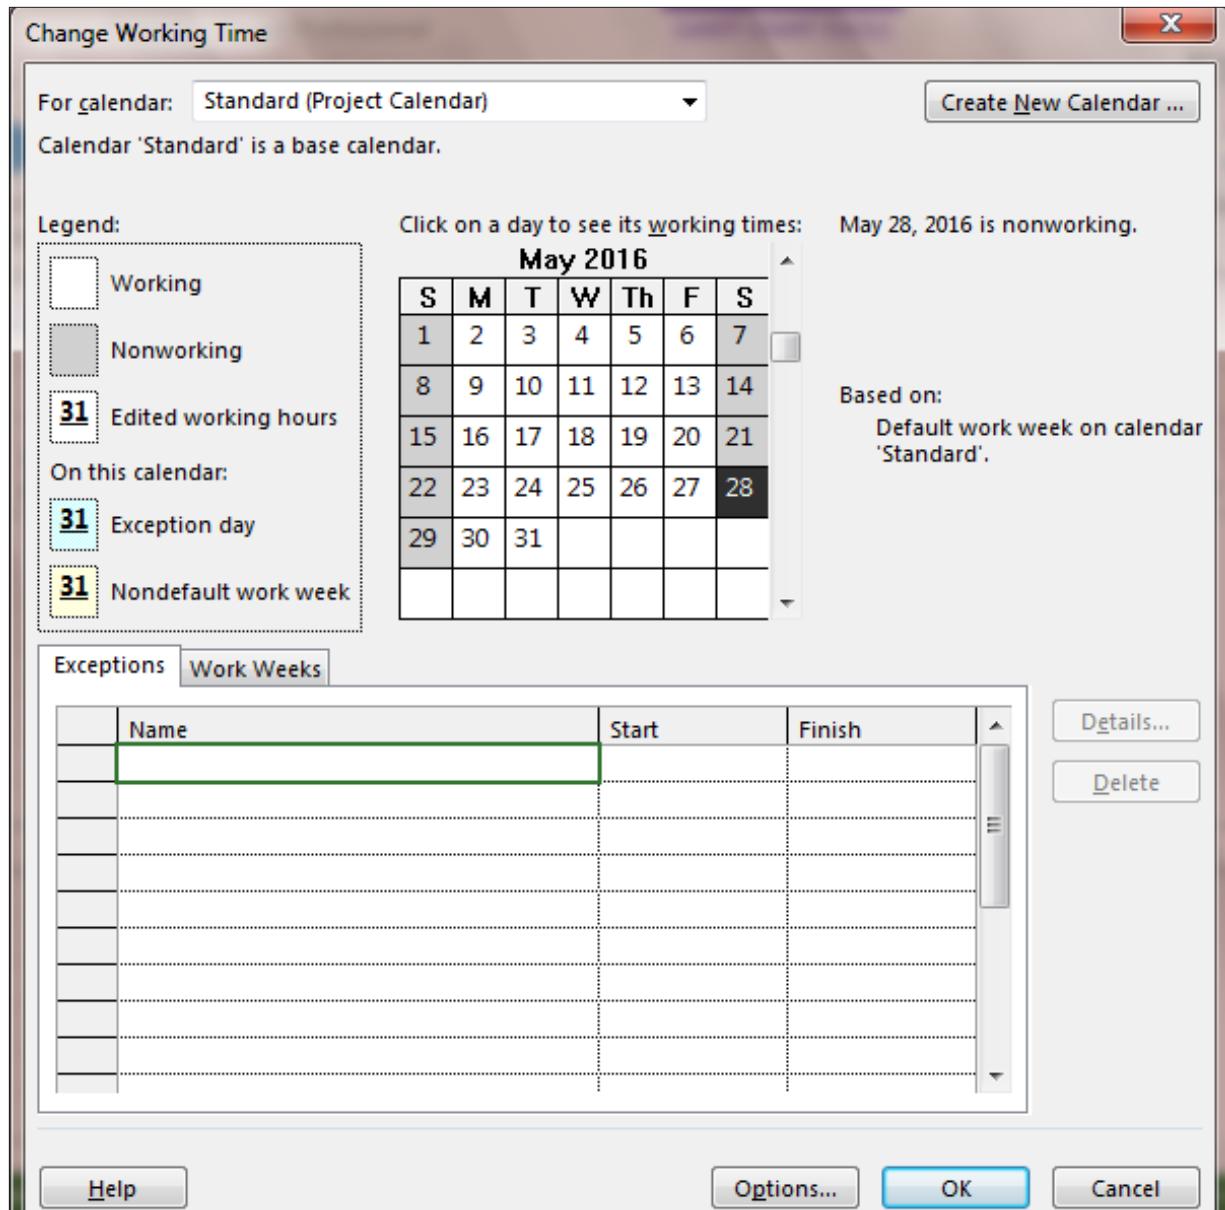

Figure 4-7 Calendar setting working hours & days

1. After clicking on the **Work Weeks** tab, the word **Default** should be highlighted. Click the **Details** button to the right of the form
2. Click **Monday**, press and hold the **shift** key and click on **Friday**. All of the working days will be selected

3. Click the **3rd radio button, Set day(s) to these specific working times**
4. You will see the standard working times. Make changes to reflect the new values
5. Click **Enter** or **Tab** to move away from the value you have changed
6. Click **OK** to close the form

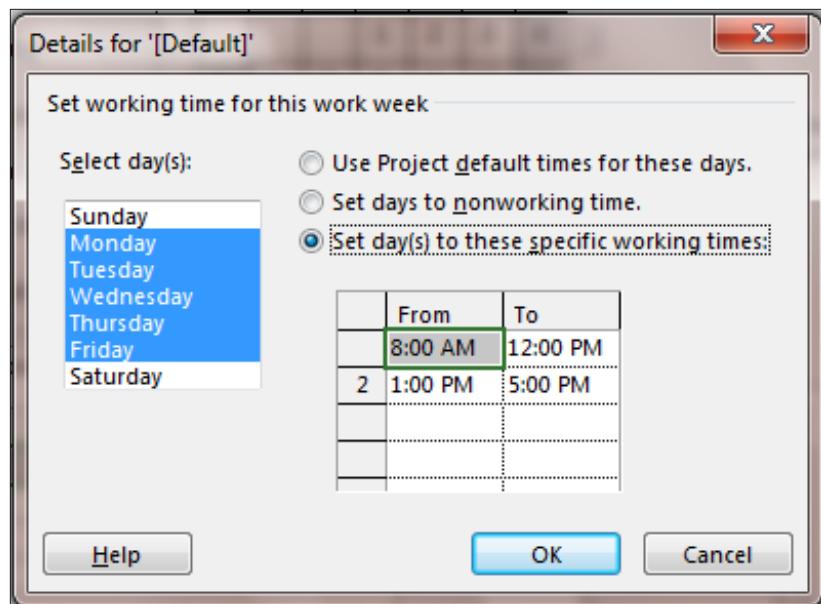

Figure 4-8 Calendar setting working hours & days specific times

Military time is valid when entering hour values. To change 5:00 pm to 4:00 pm to shorten the work day, simply enter **16** where 5:00 pm is located and click **Enter** or **Tab** and 4:00 pm will appear.

Setting Non-Working Hours and Days

Non-working time is defined in the ms Project 2013 as days where work will not be planned or performed. Examples are: national and organizational holidays, training days, company shutdowns, summer hours, etc. Adding these non-working days and times to the project calendar will prevent tasks being scheduled on this non-working days.

How to Create a Non-working Day for a Calendar

1. Click **Project → Change Working Time**
2. Check to ensure sure that the calendar you wish to change is displayed in the **For Calendar** field
3. Click **Exceptions** tab near the bottom of the dialogue box

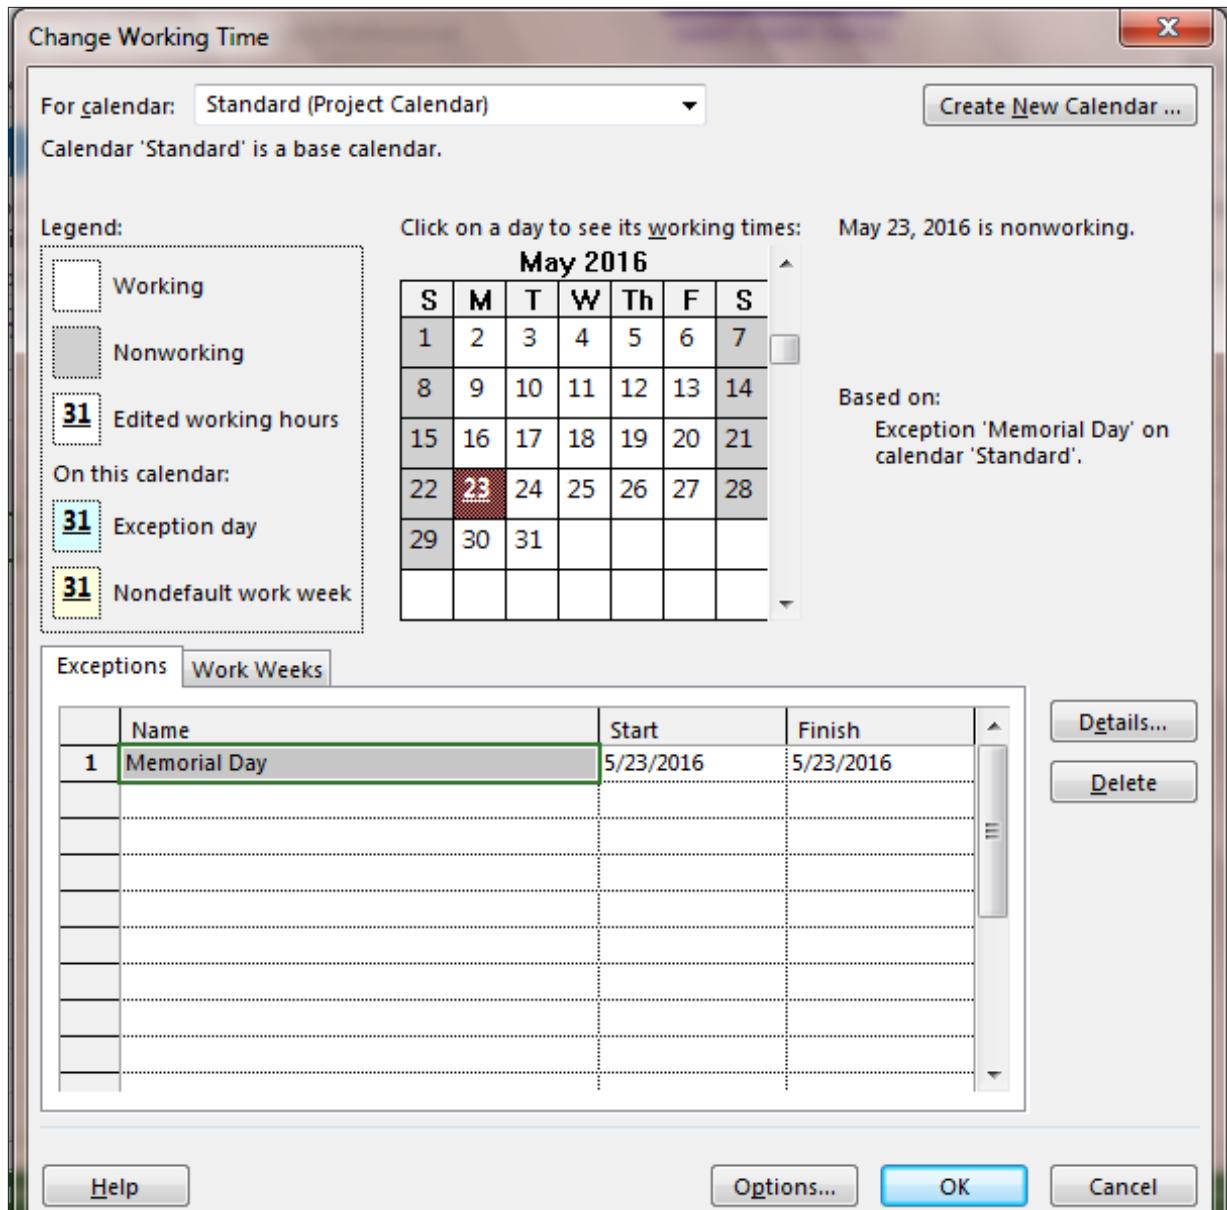

Figure 4-9 Calendar setting nonworking hours and days

4. In this example, we will set May 23, 2016 as a non-working day. Move the slider on the right side of the calendar down until **April 2011** is displayed in the calendar
 5. Click **May 23, 2016**

6. Click in the name field and enter a reason for the non-working day, ie:
Company holiday
7. Click **Enter**
8. Repeat for additional non-working days. See the result below

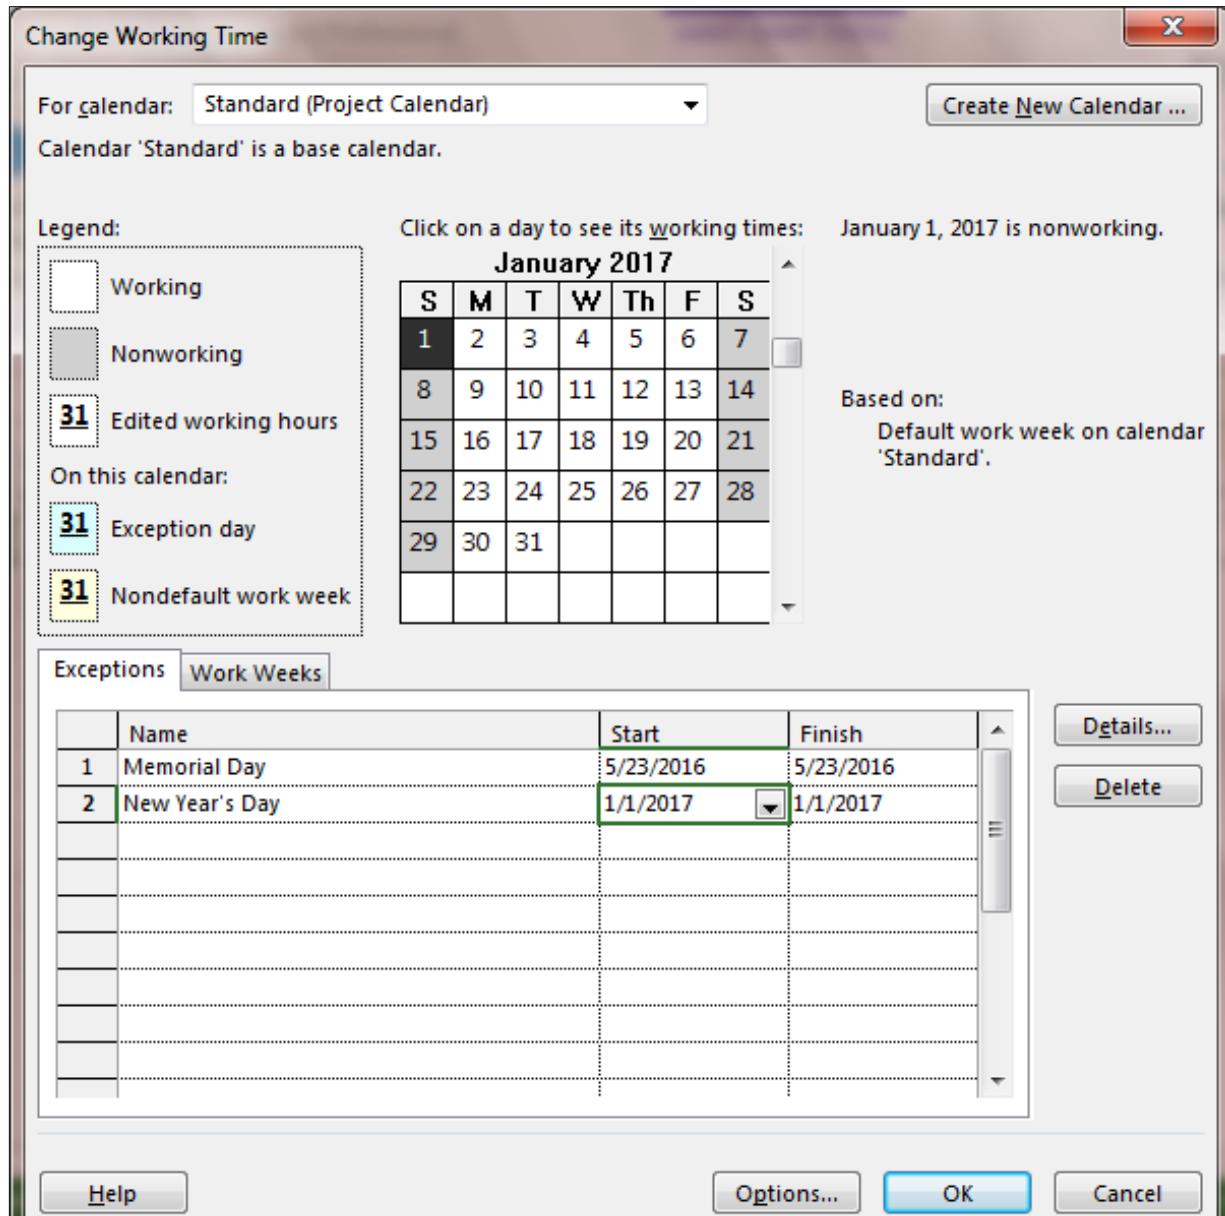

Figure 4-10 Calendar setting non-working hours & days

To Create a Recurring Non-working Day for a Calendar:

1. Click **Project → Change Working Time**
2. Check to make sure that the calendar you wish to change is showing in the **For calendar** field
3. Click **Exceptions** the tab near the bottom of the dialogue box
4. In this example, we will set January 1 (New Year's Day) as a recurring non-working day. Move the slider on the right side of the calendar down until **January 2017** is displayed on the calendar
5. Click **January 1, 2017**
6. Click in the first open line in the **Name** field and enter **New Year's Day** for the non-working day
7. Click **Enter**
8. Click back on the words **New Year's Day** and then click on the **Details** button to the right of the form
9. Click **Yearly**
10. Click on January 1
11. Enter the start date
12. Enter a recurrence value or an End by date
13. Click **OK** to close box
14. Check for the recurrence values in the Exceptions line for New Year's Day.

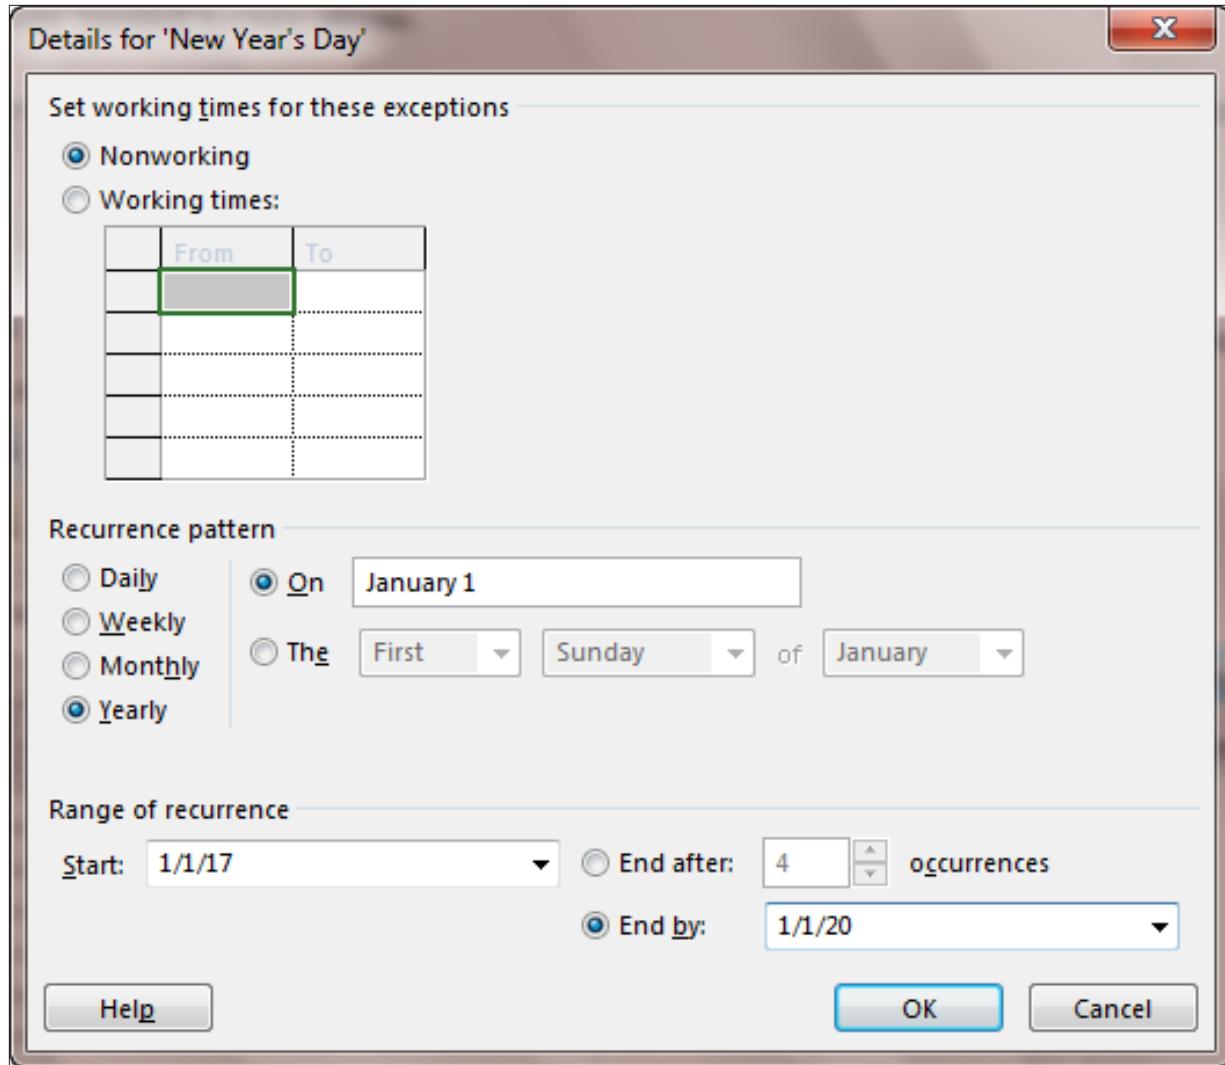

Figure 4-11 Recurring holiday values on calendar

Setting Calendar Options

The Calendar options work hand in hand with the project calendar to determine how tasks will be scheduled. It is imperative that the calendar options match the project calendar to create a consistency in the scheduling values for tasks and assignment values.

To access the Calendar options:

Click **File** → **Options** → **Schedule**

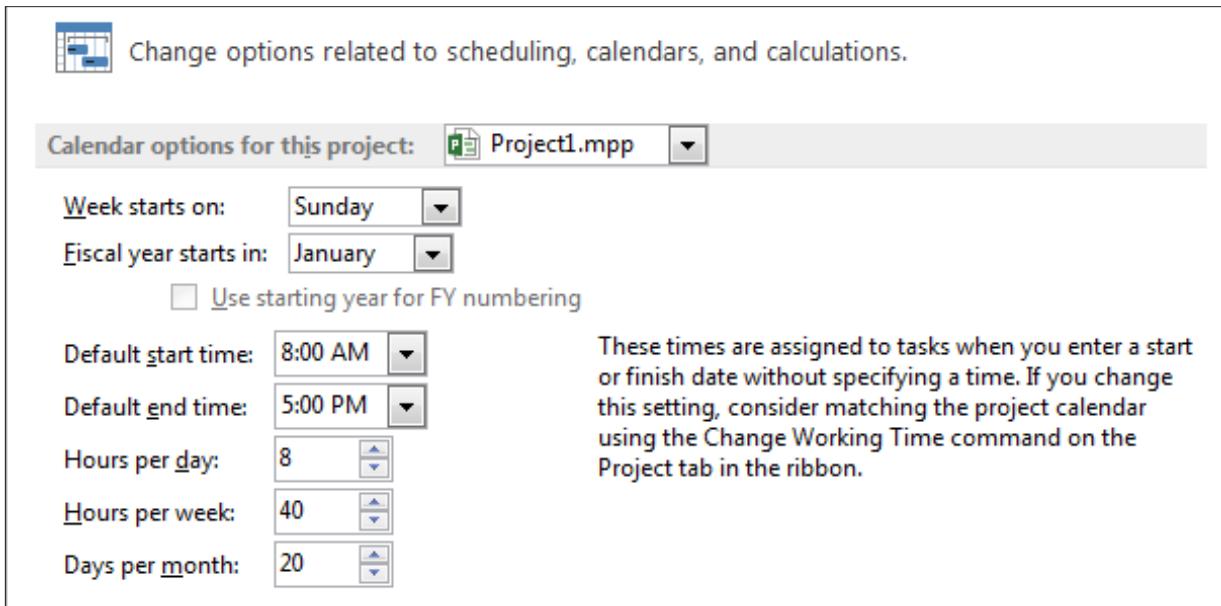

Figure 4-12 Calendar options

What the options mean:

- **Calendar options for this project:** option to select whether your option choices for the calendar will be held within an individual project or if they will be applied to all new projects.
- **Week starts on:** this choice will affect what is assigned and viewed as the first day of the week. The day chosen will be reflected on the Gantt Chart, Resource Usage, Task Usage and other calendar views.
- **Fiscal Year starts in:** if using this option, select which month will be the start of the fiscal year.

- **Default start and end times:** these values should match the time values on the project calendar. Assigning the project calendar will be discussed in the next lesson. The times stated here will be used to schedule tasks when time is not specified for a task. It will also be used to schedule tasks that do not use relationships. For example: if recurring tasks are created, the tasks will always be scheduled at the start time represented in this option.
- **Hours per day:** when 1 day of work is scheduled, how many hours should 1 day consist of?
- **Hours per week:** when 1 week of work is scheduled, how many hours should 1 week consist of?
- **Days per month:** when 1 month of work is scheduled, how many days should 1 month consist of?

Saving the Calendar

In Project 2013, the calendar that was just created is known as a “custom object”. Custom or customized objects may be saved for use in the project the object was created in and used in other projects as well. To save objects the Organizer is used. When Project 2013 was installed on your system, a file named Global.mpt was created. The Organizer is the function that will copy objects into the Global.mpt as well as between project schedules. Calendars are only one of many object types that may be customized and saved for use in other project schedules.

To save the customized calendar, the object must be copied using the Organizer.

To copy a New Base Calendar into the Global.mpt:

1. Click **File** → **Info** → **Organizer**
2. Click the **Calendars** tab
3. Click **Standard** to the right and click **<<Copy**
4. An error message will appear: “Do you want to replace the Standard in ‘Global.mpt’ with the Standard from ‘<project name.’ Indicate “Yes.”
5. Click **Cancel** to close the box

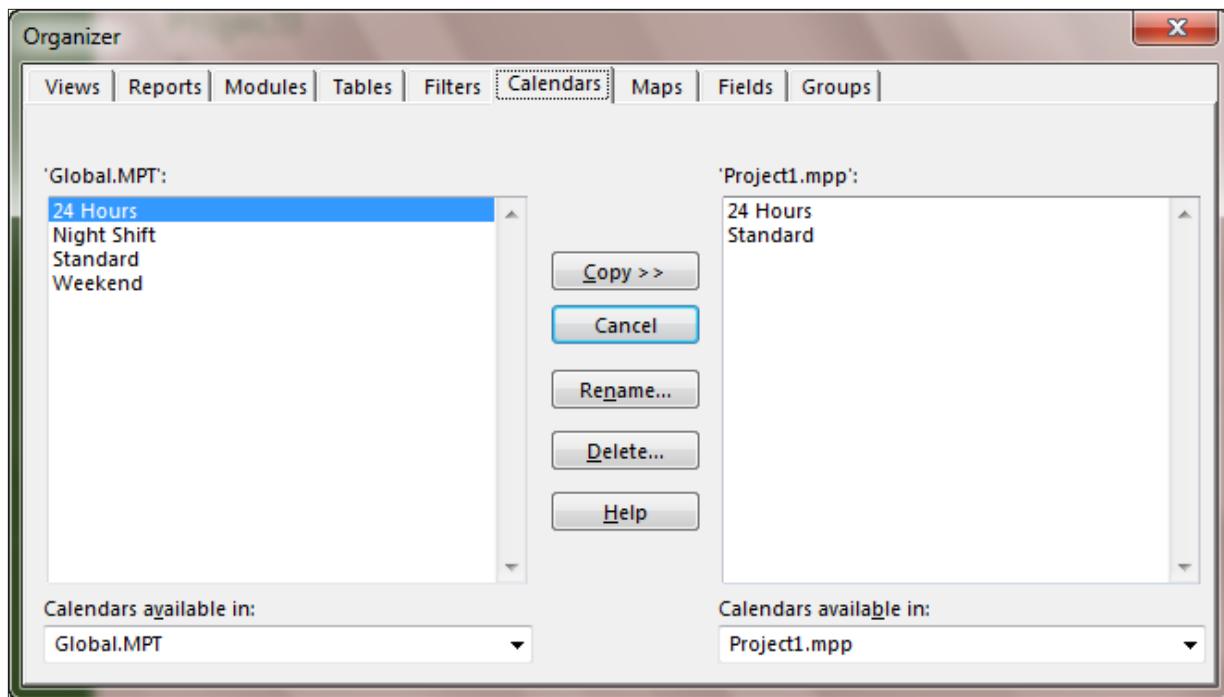

Figure 4-13 Organizer calendar view

The Calendar will be copied into your local Global.mpt.

Project Information

The project information that should be entered before proceeding with project schedule development is the project start or project finish date as well as indicating which calendar will be used as the project calendar. This information is entered through the Project Information box.

To navigate to the Project Information dialogue box:

Click Project → Project Information

Deciding whether to enter the Project Start date or the Project Finish date will take some consideration. There are pros and cons to either choice:

FAQ: Should I enter a project start and finish date?

Answer: Project 2013 will accept either the start or the finish date but not both.

Entering a start date will indicate that you are planning your schedule as forward scheduling. This will result in:

- All tasks will be scheduled As soon as possible
- The work of the project will determine the project ending date
- You will have a date to manage your project to and know when you are on time or late with the progress of the project

Entering a finish date will indicate that you are planning your schedule as backward scheduling. This will result in:

- All tasks will be scheduled As late as possible
- The ending date of the project will be locked to a date on the calendar
- You might be planning a project where each task will be required to be completed as planned to achieve the ending date goals.

The most used planning method is that projects are planned from the project start date.

Project Calendar: The default calendar is “Standard”. Whatever calendar is selected will become the scheduling calendar for the project. All tasks will be scheduled using this calendar until a resource is assigned to the task.

Click **OK** to close the box.

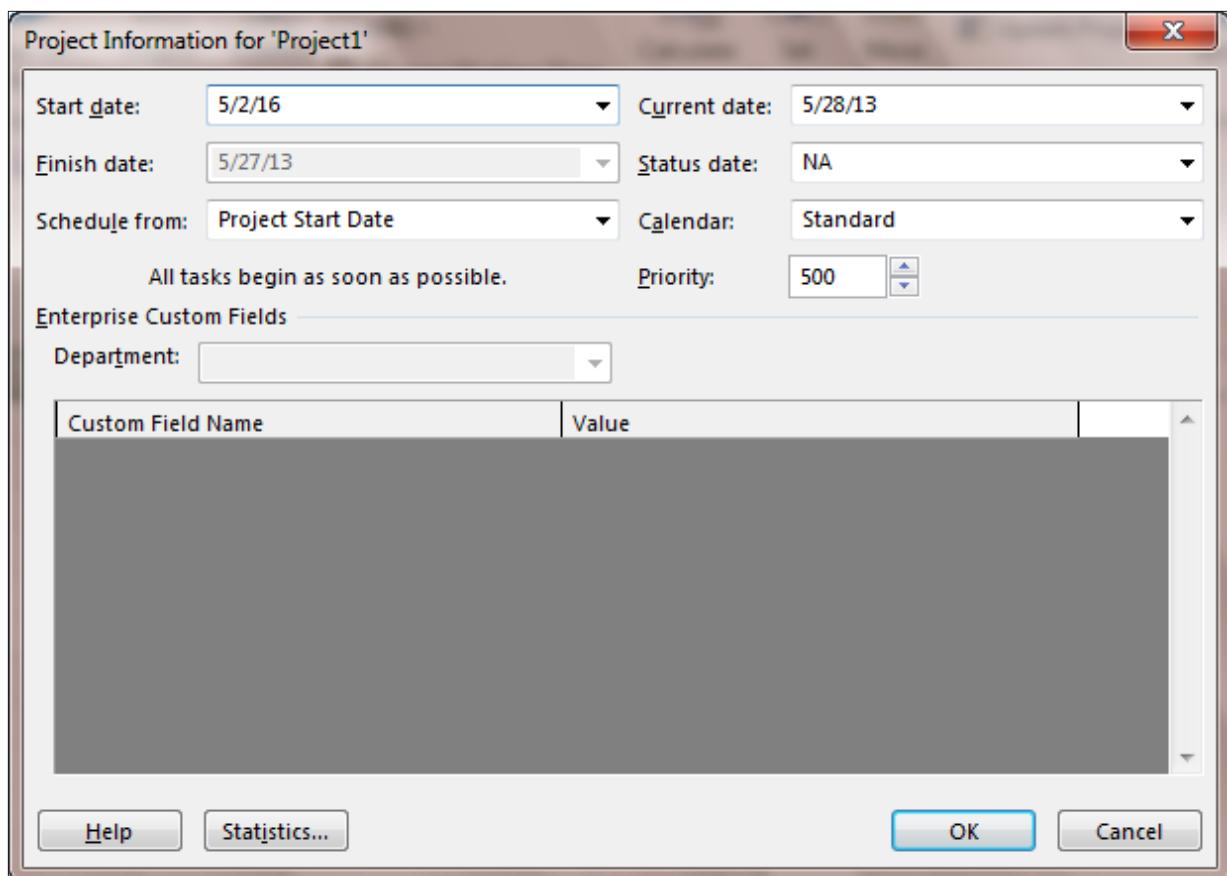

Figure 4-14 PLACEHOLDER

Most project managers have definite deadlines. Consider planning the schedule from ending date to get the schedule short term goals, deadlines and milestone dates. Then switch the project to the start date to manage. Reset the constraints to as soon as possible to enable the schedule to include slack and aid in schedule management.

Options

The last action you should be before entering your first task is to set some of the options to match the requirements of your project.

Options are flexible in that they can be applied per unique project or to all new projects created on your computer. In this section we will discuss the options that will affect scheduling. These options are in addition to the calendar options discussed earlier in this chapter.

General vs Per Project Options

General options are options which affect how the installation of Project 2013 on a desktop will operate. Per Project options are options that will apply to a unique project. You may optionally apply the per project options to all new projects.

Display options are options that will help the user interface with Project 2013 software. The options selected are unique to each user and are a personal preference. These options do not have an influence on the ability to create a project schedule.

To navigate to General options:

Click **File → Options → General**

In the Project view section, the user may select the default view for usage of Project 2013 and the date format for dates for reports and views (tables).

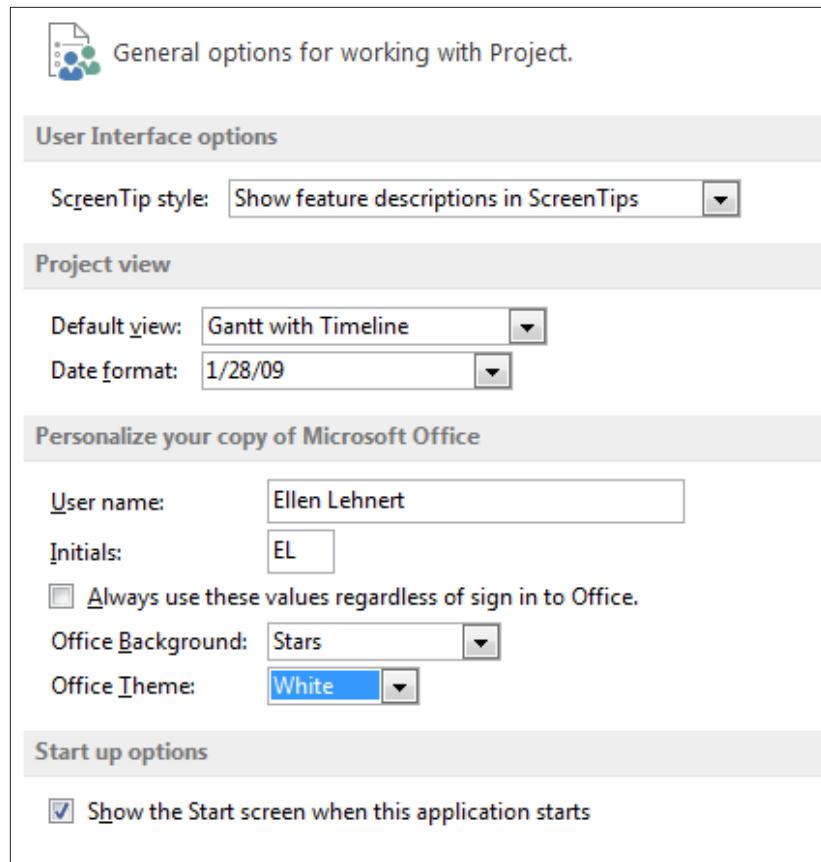

Figure 4-15 General options

To navigate to Display options:

Click **File** → **Options** → **Display**

These options refer to which elements should be viewed on the screen. These options will control which indicators are shown in the indicator column, currency values and if the Entry bar is visible or not.

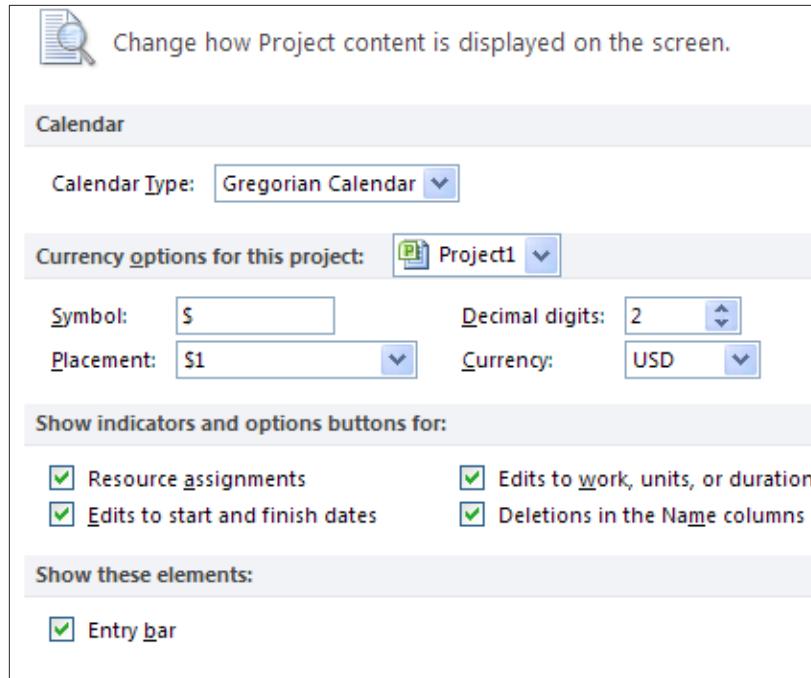

Figure 4-16 PLACEHOLDER

Additional display options are available at:

Click **File** → **Options** → **Advanced**

Some of the options that should be considered are:

- **Show this number of recent documents** – optional number, list will show in the Recent tab in the backstage
- **Automatically add new views, tables, filters and groups to the global** - recommended
- **Settings for duration label values** – Minutes, Days, etc. - may alter as needed
- **Show project summary task** – recommended

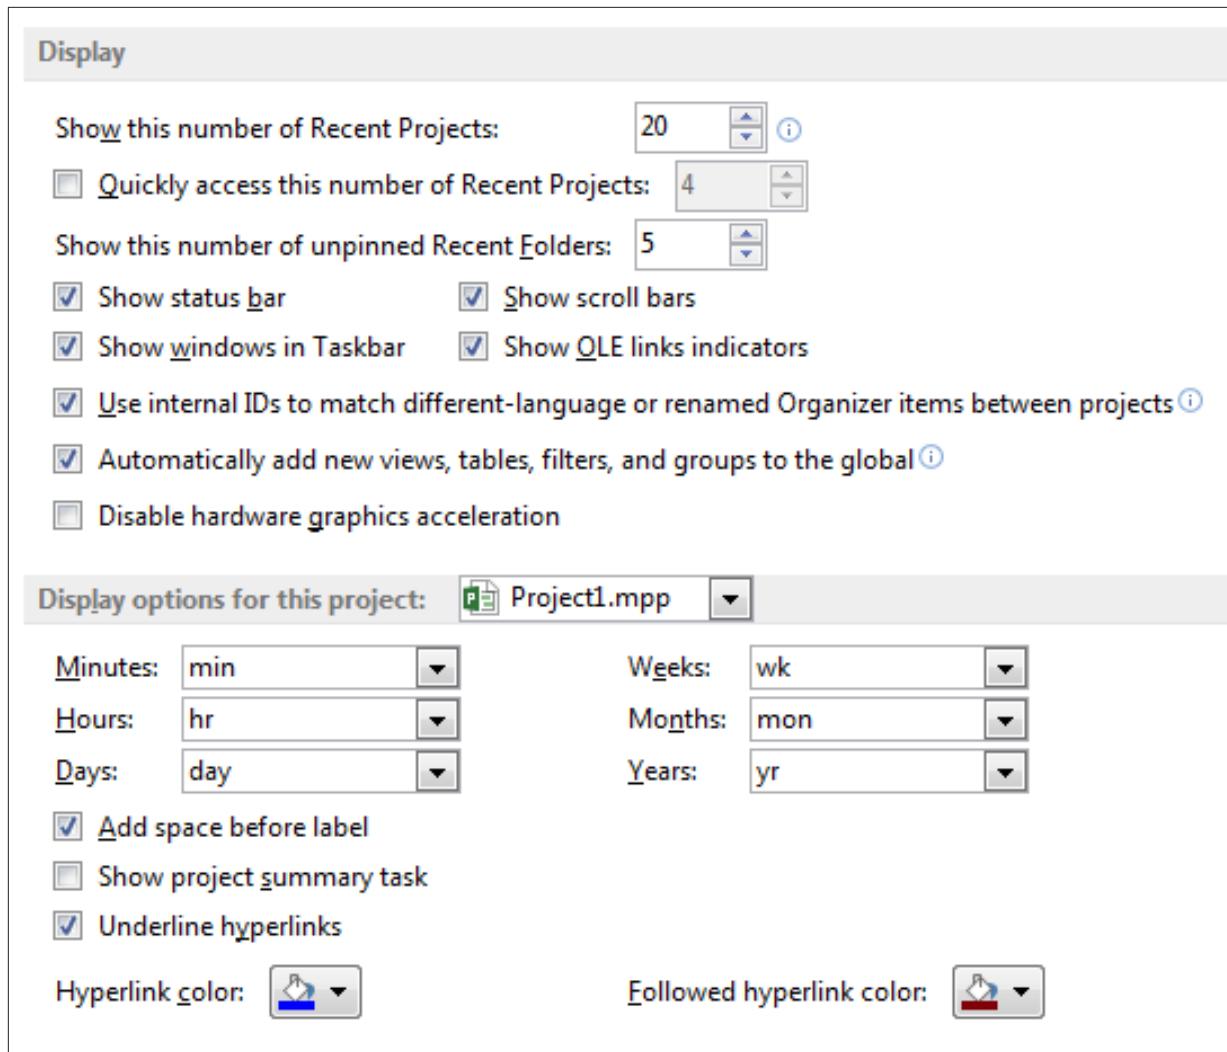

Figure 4-17 Display options in the advanced options

Each project schedule has the ability to contain a Project Summary task. The Project Summary task is a zero level task that will serve as a constant grand total for the project schedule. The setting in the above option may be used to turn on the project summary task by default for all projects.

To turn on the Project Summary task:

Click **Task** → **Gantt Chart**

Click **Format** → **Project Summary Task** (on the right side of the ribbon)

Scheduling Options

To understand the Scheduling options it would be helpful to review some of the scheduling terms the options are referring to.

ms Project 2013's schedule engine it is using the terms "Duration" and "Work" which is fundamental to understanding project scheduling.

Definitions

- **Duration:**

- Is a length of time ie: a day, a week, or a month
- It is the amount of actual time that will pass before a task is completed

- **Work:**

- Is the quantity of work that occurs ie: 8 hours in one day, 40 hours in a week
- It is the amount of work (effort or man hours) which a resource(s) will work to complete the task

It is very helpful within an organization to have a standard for these terms. IE: All work will be planned in hours and all durations will be planned in days.

Effort-driven scheduling

Tasks have the option of being scheduled using Effort-driven scheduling. Effort-driven scheduling is defined as when more workers are added to a task, the effort (or work) will be divided across the workers.

For example: A project has a task called “Moving Boxes”. The work of the task is to move 100 boxes from location A to B. If one person moves the boxes, it will take 10 hours of duration moving 10 boxes per hour. However, if 2 people move the boxes it will take 5 hours, 3 people can accomplish this task in one-third of the original time, etc.

With effort-driven scheduling the duration of the task will shorten when more workers are added because the work is divided over the resources.

Define Duration, Work, Task Types and Effort Driven

Understanding Task Typing

Each task will be assigned a task type when the task is added to the schedule. Task types work hand-in-hand with the effort-driven option discussed above. Task types will determine how a task is scheduled and will have an effect on the assignment of the resources to the task. Task types are considered unique per task and should be set on a task by task basis.

The option will be setting is to establish the default task type you would like each task to acquire when it is entered. Task types may be changed to match the needs of the tasks at a later point in time.

MS Project 2013 allows for the following 3 task types:

- **Fixed Duration:** A fixed duration task is a task created with a fixed length of time. Fixed Duration tasks are also tied to dates.

Example: This training class. When the time scheduled for this class is over, the work of the class is completed.

- **Fixed Units:** Units means quantity of resource. Fixed Units means that the resource assignment quantity is fixed for the task. Using this task type will result in the quantity of the units assigned to a task coupled with the availability of the resource to determine the scheduling of the task.

Example: If you assign a resource to a 5 day, 40 hour task at 100% of their effort the task will be completed in 5 days working 8 hours per day. If you assign a resource to the same task with 50% of their effort, the task will be worked 4 hours per day and will be scheduled for 10 days of duration. The 100% and 50% are the resource units.

- **Fixed Work:** The work of the task is fixed. Fixed work tasks, by default, are also effort-driven. The more resources assigned to the task, the less time the task will take to be complete. Fixed work tasks will be scheduled based on the quantity of the units of the resources assigned to the task and their availability based on their resource calendar.

Example: If a task called “Plan event” will take 80 hours of work to complete, the work will be completed in 2 weeks with 1 full time resource. If a second resource is added full time, the task will be completed in 1 week dividing the work between the 2 resources. Each resource would have performed 50% of the work. As resources are added to the task, the duration of the task is reduced.

Task type, Effort-driven combinations

When task types are coupled with the effort-driven option, the scheduling engine allows for the following task type, effort-driven combinations:

- Fixed Duration, Effort-driven on
- Fixed Duration, Effort-driven off
- Fixed Units, Effort-driven on
- Fixed Units, Effort-driven off
- Fixed Work, Effort-driven on

The project options will allow for setting a default that each task will be assigned when the task is entered. It should be noted that each task is

different and unique. The default should be considered a starting point.

Scheduling Options

Scheduling options are per project options which establish the defaults how a project will be scheduled. These options are unique per project and should be checked before entering tasks into a project schedule. These options also may be changed at any time over the life of the project schedule.

To set the scheduling options:

Click **File → Options → Schedule**

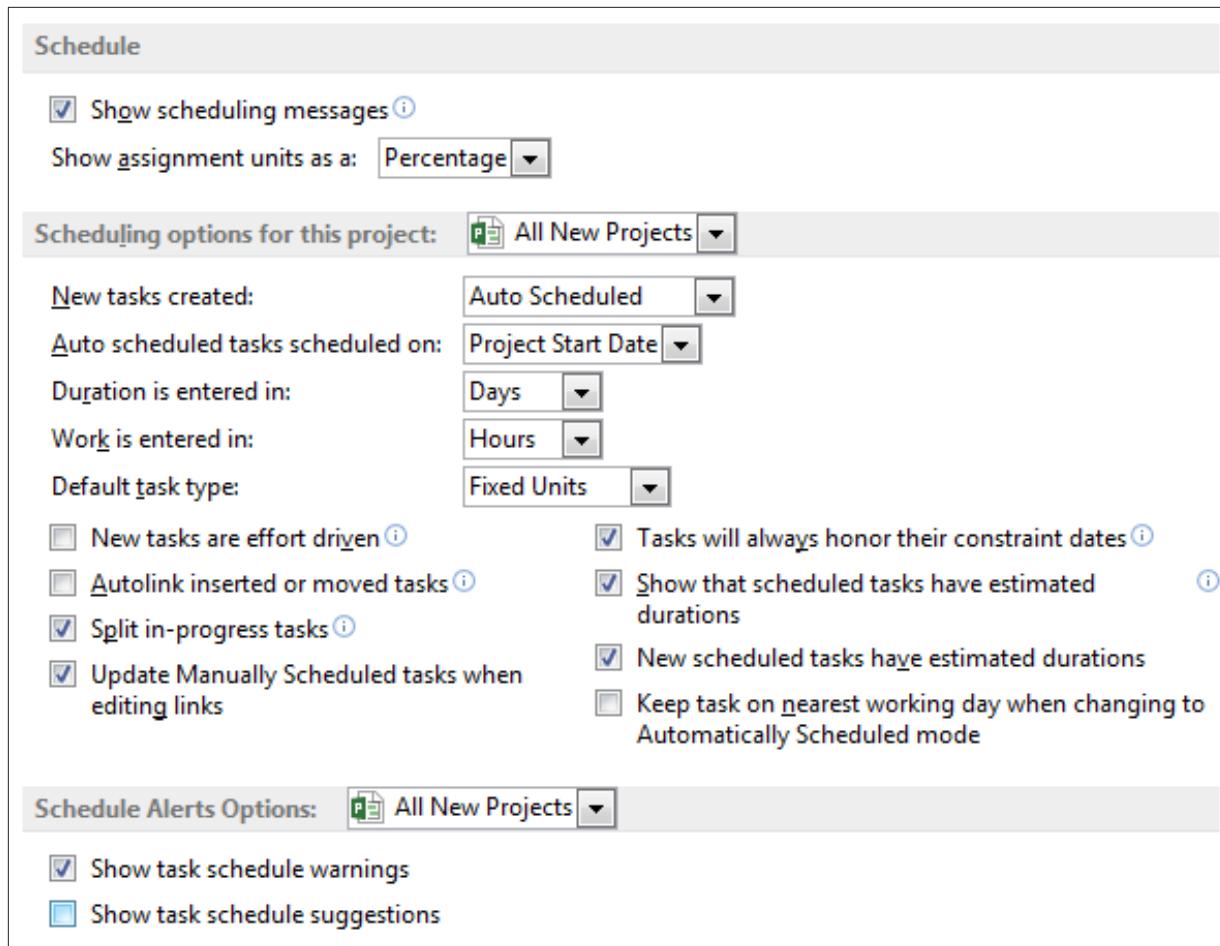

Figure 4-18 Schedule options

- **Show scheduling messages:** gives the scheduler error messages concerning scheduling inconsistencies and warnings.
- **Show assignment units as a:** options are percentage or decimal. This is user preference. It may be changed at any time without affecting the schedule.
- **Scheduling options for this project:** options that can be assigned to a specific project or all projects.
- **New tasks created:** manually scheduled or automatically scheduled. This is the default value and may be adjusted per task.
 - **Manually scheduled:** tasks will be entered without a start or finish date and without task duration. All values are entered manually.

- **Auto scheduled:** tasks will be entered with a default duration of 1 day and a start and finish date.
- **Auto scheduled tasks scheduled on:** project state date or current date. If you are managing a long project it might be easier to change this option for all new tasks to start on the current date.
- **Duration is entered in:** minutes, hours, days, weeks, months
- **Work is entered in:** minutes, hours, days, weeks, months
- **Default task type:** Fixed Units, Fixed Duration, or Fixed Work
- **New tasks are effort driven:** check for yes
- **Update Manually Scheduled tasks when updating links:** when tasks are manually scheduled should the project schedule successor tasks based on realtionship links

It is a good idea within an organization to establish a standard for Duration and Work. When duration is discussed or appears on a report it will be easier for stakeholders to understand that duration always means hours or the value that works for the specific project. If you have a 3 year project, you probably will not be planning work at the hour level so weeks might be the duration standard.

Chapter 5

Task Development

Creating the Work Breakdown Structure

Once the tasks of the project are established, the next step is to enter the tasks into the project schedule and create a WBS structure. Entering tasks may be a manual keying process or they may be imported from a SharePoint list (Project 2013 Pro only), an Excel workbook, an Outlook task list or a Word document. Tasks may also be copy and pasted into project schedules. This lesson addresses the manual entering of tasks into the project schedule.

In this lesson, we will discuss:

- WBS
- Entering tasks
- The Task Information Form
- Outlining tasks into a WBS Hierarchy
- Displaying WBS code values
- Customizing WBS code numbers
- Manual vs Automatic

Overview of Work Breakdown Structure

The next step in creating a project schedule is to enter the tasks for the project. What work should be planned and how should the tasks be organized? The Work Breakdown Structure or WBS is the task list for the project. How the WBS is structured will have influence reports that are generated from the schedule and ease of managing the schedule. These questions and others need to be answered in order to create a project schedule that will help you manage your projects.

What is a Work Breakdown Structure or WBS?

Simple projects like packing for a trip might not need a plan to accomplish the project. When packing, most people will make a list of the items to pack. Everything on the list is added to the suitcase and the project is completed. Not all projects are this simple.

Larger projects like building a house will require more planning and detail to accomplish the goals of the project. More tasks will be required, more detail and organization to the detail. More data will be accumulated regarding how the project was performed. To accomplish these types of projects, a work breakdown structure or WBS will be required.

The WBS is a hierarchical structure much like an outline list. This structure will contain the work of the project. When developing a WBS the total work of the project is divided into chunks of work. The larger chunks are subdivided into smaller chunks. After the work is divided it is then organized into a hierarchical structure. Within the structure some tasks will serve as titles, some tasks will be goal points and others will contain task work details.

Consider the WBS of a project the same as the foundation for a building. Without a stable foundation the building will not be stable. Having a stable or well-planned WBS will be an asset to the performance of a project. Having an unstable WBS may adversely affect the management of the project schedule.

Task Categories

When building a WBS using MS Project 2013 there are 4 categories of tasks available to use. The categories are:

Project Summary Task: This is a task that will provide title and a grand total for the project. It is the top level task (level 0) and it can be turned on and off as needed.

Summary Tasks: These tasks are section titles that will also provide subtotals throughout the project.

Tasks or Detail Tasks: These are work tasks within the project. Work tasks will carry the work and duration for the project as well as costs.

Resources or workers will be assigned to this task category and tracking will occur for these tasks.

Milestones: Milestones are points in time. They become the goal points within the project and can provide high level timeline reports.

Entering Tasks

Entering tasks into Project 2013 is as easy as typing the task name into the Task Name field. When entering a new task, keep in mind that data is being populated in an array of fields for that row; several hundred fields will be created and some populated. After tasks are entered they may be moved, deleted, or copy/pasted to other areas of the schedule. It is also recommended that the Project Summary Task be turned on to aid in schedule development.

To turn on the Project Summary task:

- Click on **Format** → **Project Summary Task** (In the show/hide section on the right)
- Click the **check box** to turn on

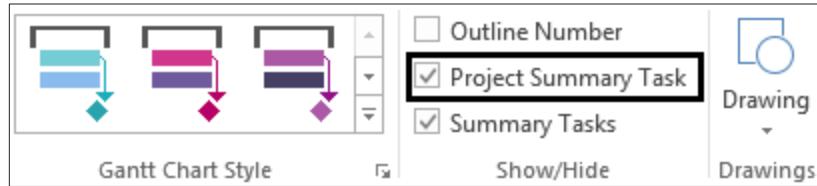

Figure 5-1 Project Summary Task

To enter a new task:

- Click the **Task Name** field on the row you would like to enter and type the task name.

To move a task to another location in the schedule:

- Left Click on the task number (**ID**) in the left column. Hold the click down and wait for the 4 way arrow to appear and drag to the task to the new location. (Works well when the new location can be seen on the screen)

OR

- Click on the **task number** of the task you wish to move
- Click **copy** (or cut)
- Scroll to the new location

- Click **Paste** – Project 2013 will insert the pasted task

		Task Mode	Task Name	Duration	Start	May 1, '16
0			▪ Sell my house	1 day	5/2/16	S
1			Fix up house to sell	1 day	5/2/16	M
2			Paint bedrooms & Family Room	1 day	5/2/16	T
3			Replace carpeting	1 day	5/2/16	
4			Repair roof	1 day	5/2/16	
5			Fix up completed	1 day	5/2/16	

Figure 5-2 Task number

Entering blank lines to receive the moved tasks is not necessary. The schedule will insert the lines and move tasks down to accommodate the moved tasks.

To add blank lines schedule between existing tasks:

- Right click on the **task** below the location of the new task to be inserted
- Click **Task → Task** – a blank row will be created above the task selected
OR
- Click on a task
- Click **Insert** key on the keyboard

In the view below task 6 was entered using the Task → Task insert method. Note the default data and <New Task> name entered. Task 8 was the result of clicking the Insert key on the keyboard.

		Task Mode ▾	Task Name ▾	Duration ▾	Start	May 1, '16
		S	M	T		
3		Replace carpeting	1 day	5/2/16		
4		Repair roof	1 day	5/2/16		
5		Fix up completed	1 day	5/2/16		
6		<New Task>	1 day?	5/2/16		
7		Clean up House	1 day	5/2/16		
8						
9		Clean out storage space	1 day	5/2/16		

Figure 5-3 Task 6 was created by clicking on the “Clean Up House” task and click on the Insert → Task button on the Task ribbon. Task 8 was created by clicking on the “Clean out storage space” task clicking the insert key on the keyboard.

To delete tasks from the schedule:

- Right click the task to be deleted
- Click **Delete Task** option
OR
- Click the task to be deleted
- Click the **Delete** key on the keyboard

If you have clicked anywhere within the task row and deleted the task a Smart Tag will appear to ask if you want to clear the field or delete the task.

In the view below the result of clicking on the Smart Tag (the X with the down arrow) is shown. Make your selection from the choices in the box below.

		Task Mode ▾	Task Name	Duration ▾	Start	May 1, '16
						S M
3		Replace carpeting	1 day	5/2/16		
4		Repair roof	1 day	5/2/16		
5		Fix up completed	1 day	5/2/16		
6		<New Task>	1 day?	5/2/16		
7		Clean up House	1 day	5/2/16		
8		X ▾	1 day	5/2/16		
9		<input checked="" type="radio"/> Delete the task name.	1 day	5/2/16		
10		<input type="radio"/> Delete the task.	1 day	5/2/16		
11		Clean up completed	1 day	5/2/16		
12		Hire Realtor	1 day	5/2/16		

Figure 5-4 Smart tag asking the user to select if the task name should be cleared or the entire task deleted.

Moving and Copying Tasks

If you want to create a task that is similar to an existing task, you can copy the existing task and then modify the copy.

To copy a task:

1. Select the entire row of the task you want to copy by clicking on its ID field. If you only want to copy one field, such as the task name, select only that field.
2. In the **Task Tab**, **Clipboard** group, click **Copy**. Project copies the task to the Clipboard.
3. Select the task below the line the task will be inserted.
4. In the **Task tab**, **Clipboard** group, click **Paste**.

Keyboard shortcuts **Ctrl+C** (copy) and **Ctrl+V** (paste) will work as well.

You can also copy a single cell of data, rather than the entire task row.

Be aware that when you paste the contents of a single field, Project overwrites the contents of the field into which you paste. If you paste the single field into a blank row, Project creates a new task.

To move a task:

1. Click the ID number of the task to select the entire row.
2. Drag the entire task to the new location, between two existing tasks.

If you drag the contents of a single field to another field, Project overwrites the contents of the field.

If you move a task that is within a series of tasks that are linked sequentially, Project automatically adjusts the link relationships of the remaining tasks to reflect the new task order. Project does this only if the current task is linked to the task directly above and below. The moved task will maintain the original link to predecessors. Linking to a new series will need to be done manually.

Task Information Form

The Task Information box is a source of easy access for some of the frequently used fields on the task side of the data for a Project 2013 project schedule. Data entered in the form is the same as entering data into a column in a table for a task. Using this box is a quick and easy way to view and maintain task information.

To access the Task Information Form:

- Double click an **task data** field within a task
- OR
- Click on a **task**
- Task **ribbon → Information**

The form below will appear:

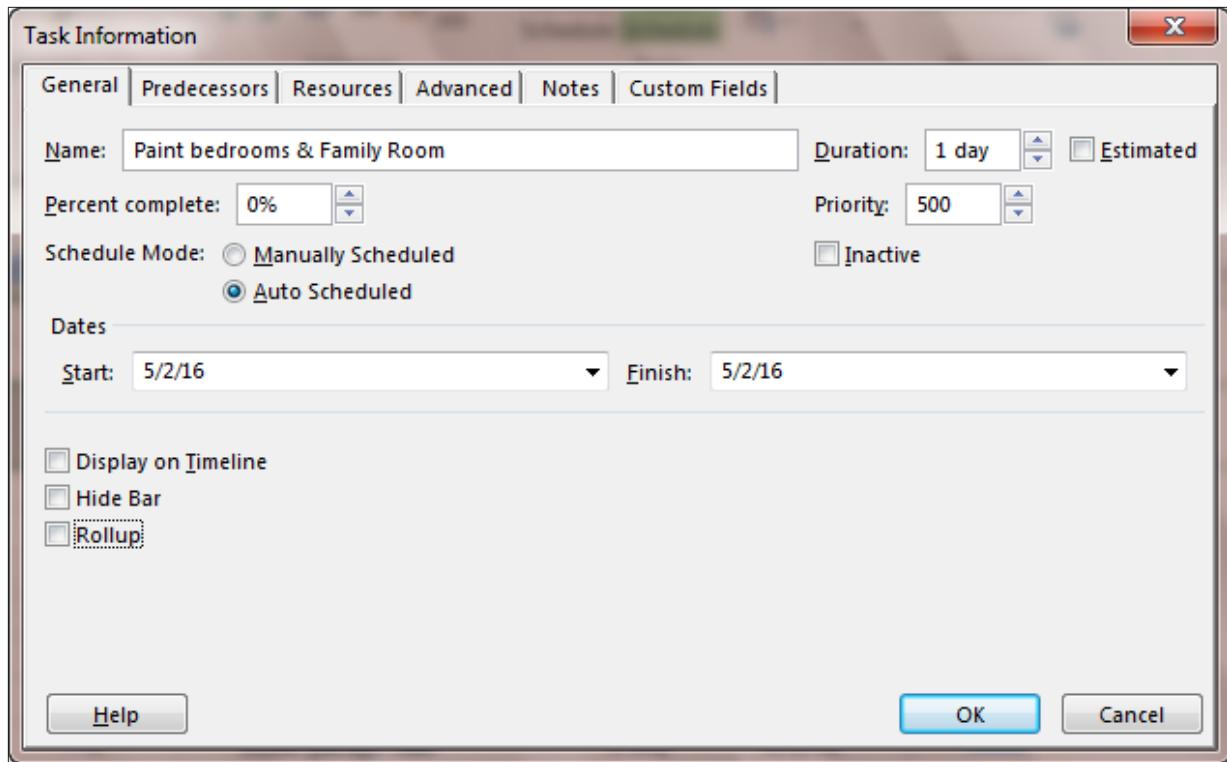

Figure 5-5 Task info box

The form contains several tabs of information, grouped by subject. Each tab will allow access to the Task name, Duration and Estimated flag.

General tab: contains Name, Duration, Percent complete, Priority, Schedule Mode, Inactive, Start and Finish dates, Display on Timeline, Hide Bar and Rollup.

Predecessors: contains information concerning task relationships.

Resources: contains information concerning resources assigned to the task.

Advanced: contains information concerning Deadlines, Constraints, Task Types, Task Calendars, Effort-driven flag, wbs number and Milestone flag for the task.

Notes: general notes area for the task

Custom fields: If task level custom fields (user-defined) were created for the project, they would be accumulated and accessible through this area.

Data may be changed in multiple tasks at the same time. Select the tasks to be changed and then click on the Information icon on the Task bar. The box that appears is called the Multiple Task Information box. Make the changes and click **OK** to update.

		Task Mode ▾	Task Name	Duration ▾	Start	May 1, '16
0			1 Sell my house	1 day	5/2/16	S M
1			Fix up house to sell	1 day	5/2/16	
2			Paint bedrooms & Family Room	1 day	5/2/16	
3			Replace carpeting	1 day	5/2/16	
4			Repair roof	1 day	5/2/16	
5			Fix up completed	1 day	5/2/16	

Figure 5-6 Select multiple tasks

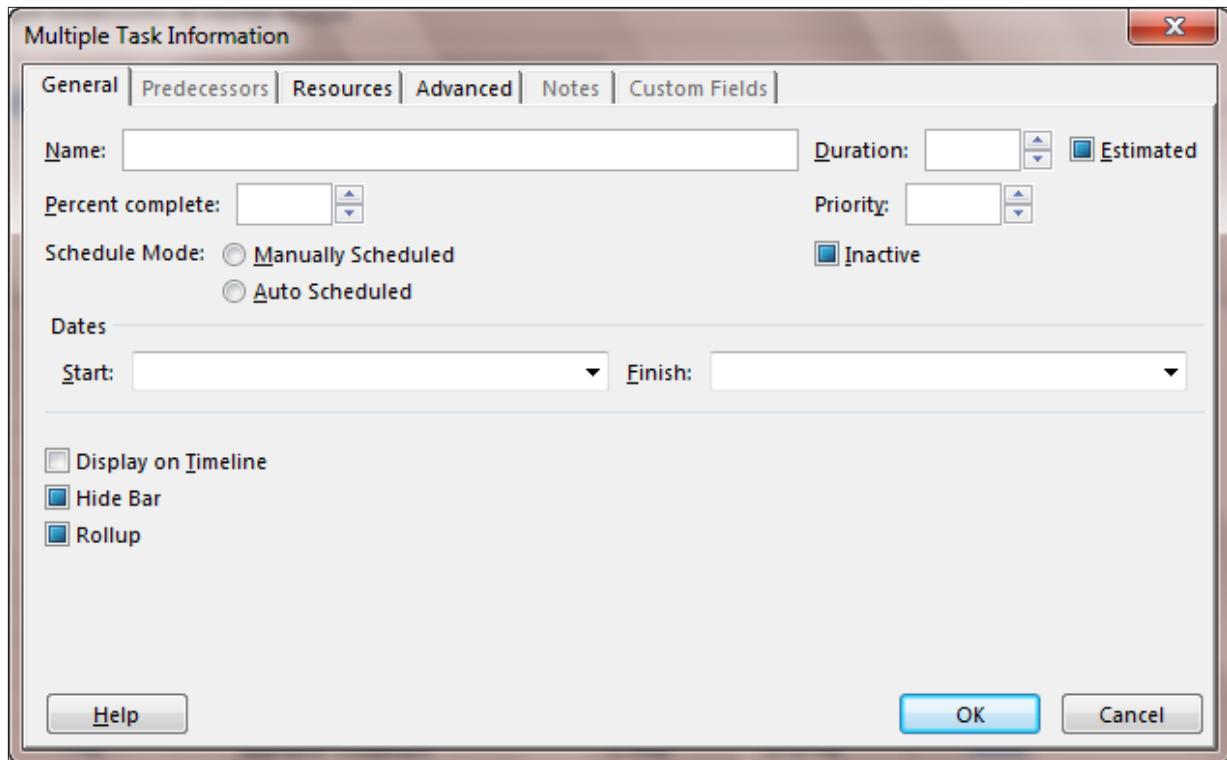

Figure 5-7 Multiple task info box

Selecting multiple tasks and then clicking on the Information icon will allow for values to be changed for all of the selected tasks.

Outlining Tasks into a Hierarchy

Once tasks are entered, the WBS outline structure may be created. To create the outline structure, tasks will be indented or outdented. These buttons are located on the Task ribbon in the schedule section and are the green arrows in the lower left corner. The indent button is pointing to the right. The outdent button is pointing to the left. See below:

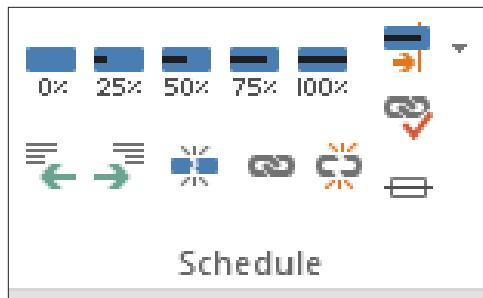

Figure 5-8 Schedule section of Task ribbon bar. Outdent is in the lower left corner, arrow pointing to the left. Indent has the Arrow pointing to the right.

To indent a task:

- Click the task to be indented
- Click the **indent** (pointing right green arrow)
- OR
- Place the mouse pointer over the task and a horizontal arrow will appear. Left click and drag the task to the right

To outdent a task or remove an indentation:

- Click the task to be outdented
- Click the **outdent** (left pointing green arrow)
- OR
- Place the mouse pointer over the task and a horizontal arrow will appear. Left click and drag the task to the left

When a task has an indented task below it, the task becomes a summary task. Summary tasks are represented as black bars on the Gantt chart as shown below:

Task Name	Duration	Start	May 1, '16
	S	M	
▪ Sell my house	1 day	5/2/16	
▪ Fix up house to sell	1 day	5/2/16	
Paint bedrooms & Family Room	1 day	5/2/16	
Replace carpeting	1 day	5/2/16	
Repair roof	1 day	5/2/16	
Fix up completed	1 day	5/2/16	

Figure 5-9 The task named “Fix up house to sell” became a Summary task when all of the tasks below it were indented. Note the summary task formatting on the

Gantt Chart.

Indenting and outdenting can be confusing. At times it is difficult to achieve the desired structure results.

When indenting, work from the top down. When outdenting, work from the bottom up.

To see the levels of the WBS:

Project Summary tasks and Summary Tasks will have a small box to the left of the summary task name as seen in the screen above.

- Click the **plus** sign + to expand tasks
- Click the **minus** sign – to collapse tasks

Use the Outline button to jump to a level of detail:

Click on **View → Outline**:

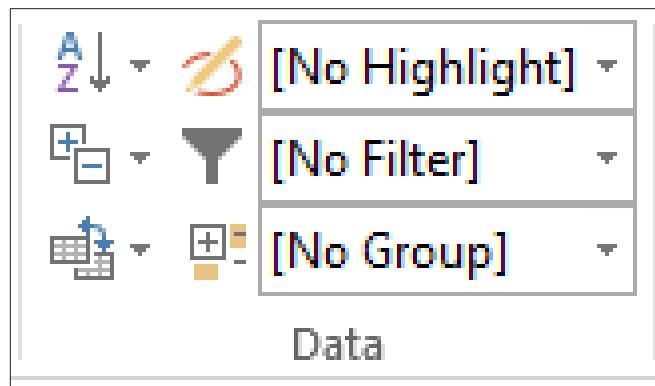

Figure 5-10 The Outline button is in the Data section of the View ribbon bar. Use this button to view various levels of the WBS.

When the **Outline** down arrow is clicked, the following choices appear:

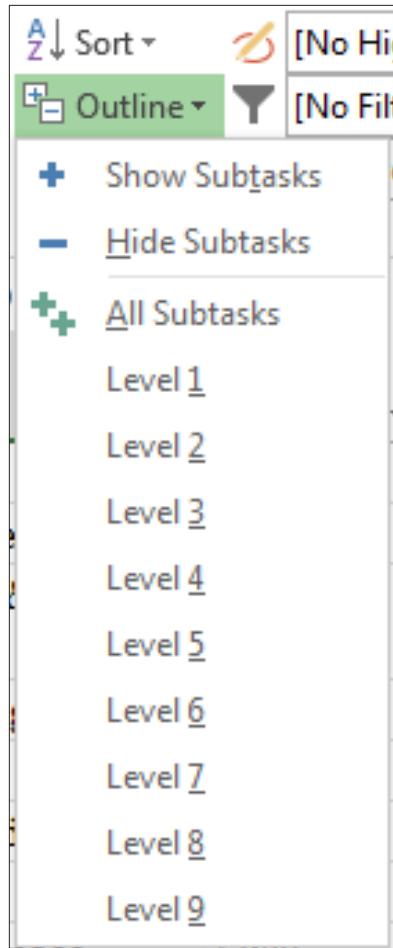

Figure 5-11 Clicking on the Outline button will reveal choices for selecting the outline detail level to view.

The following image shows a view of a collapsed WBS – **Outline level 1** was selected. Note the rolled up view of the tasks:

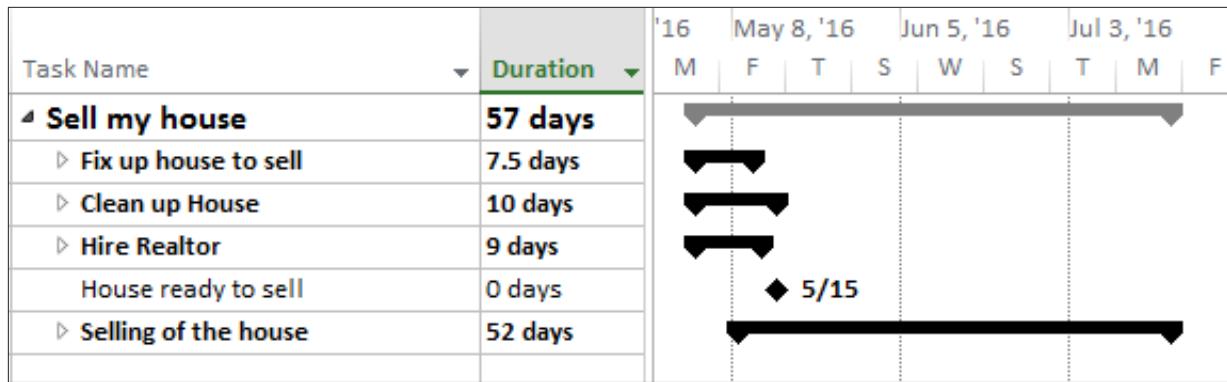

Figure 5-12 The result of selecting Outline 1 which will collapse the detail to the highest level

The following image shows a view of an expanded outline wbs – All Subtasks was selected:

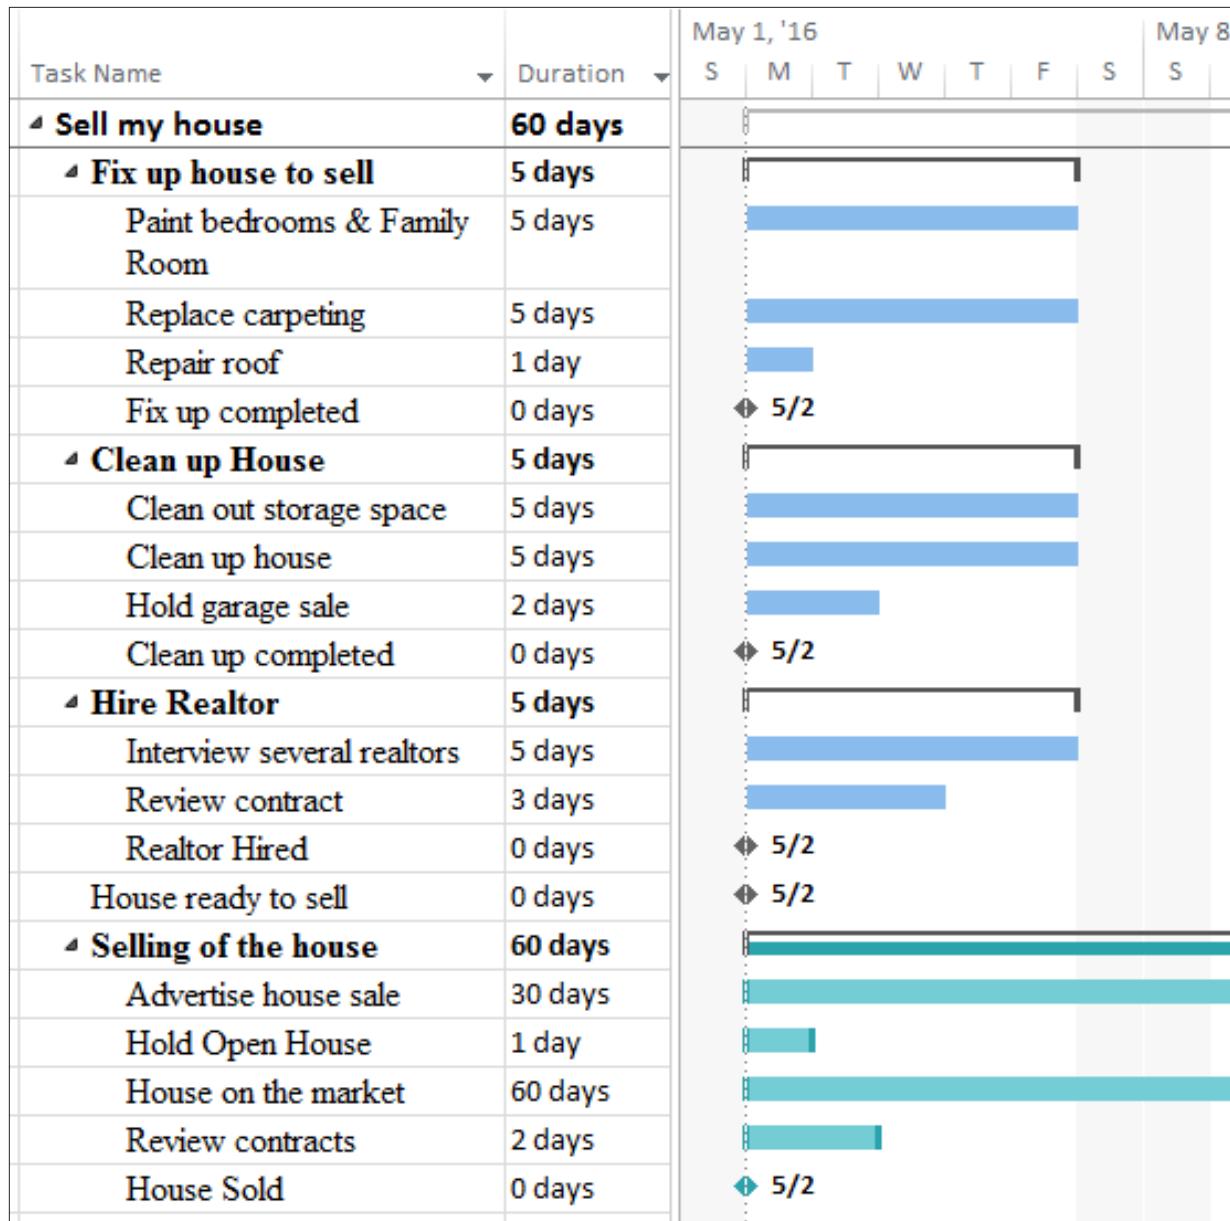

Figure 5-13 All tasks

Clicking **Project Summary** task and then **Hide Subtasks** will collapse the project down to just the Project Summary task.

If the outline is collapsed, clicking **All Subtasks** will show all tasks at all levels of the wbs.

The outline list offers the option to create up to 9 WBS levels. There are many more levels available in Project 2013 but it is advised that WBS levels should not exceed 5. The more WBS levels there, the more confusing and cumbersome a WBS may become.

Displaying Outline Numbers & WBS

As the WBS structure is created, an automatic numbering sequence is also created within the task list. The numbers represent where in the WBS structure the tasks reside. This is a unique numbering scheme and numbers are automatically reassigned as tasks are moved around the WBS structure.

There are default number values and customized WBS number values. In this lesson, we will address the standard WBS values; the following lesson will address the customized values available.

To view insert the WBS column into a table:

- In the Gantt chart view right click on a column heading. To Insert a column into a table, right click on the column header to the right of where you would like the inserted column to be located. After the column is inserted it may be moved to an alternate location if needed.
- Select Insert Column
- Click the **W** key on the keyboard
- Select “WBS”
- Click **OK**

Below is an example of WBS numbering schema:

WBS	Task Name
0	▫ Sell my house
1	▫ Fix up house to sell
1.1	Paint bedrooms & Family Room
1.2	Replace carpeting
1.3	Repair roof
1.4	Fix up completed
2	▫ Clean up House
2.1	Clean out storage space
2.2	Clean up house
2.3	Hold garage sale
2.4	Clean up completed
3	▫ Hire Realtor
3.1	Interview several realtors
3.2	Review contract
3.3	Realtor Hired
4	House ready to sell
5	▫ Selling of the house
5.1	Advertise house sale
5.2	Hold Open House
5.3	House on the market
5.4	Review contracts
5.5	House Sold

Figure 5-14 The WBS column is displaying the system assigned WBS numbers associated with the tasks.

Because automatic WBS numbers are updated as tasks are moved or added to the WBS, it is not recommended that these numbers be used as a task tracking number. If a task tracking number is desired, consider using the field called "Unique ID". This field is the order, in which tasks were added to the schedule and they will always be unique and will not be duplicated within a schedule.

Collapsing and Expanding the Outline

One of the main benefits of outlining is that you can control the level of detail that Project displays. For example, if you want to inform upper management about the status of your project, they may not be interested in the daily tasks, only the major phases. You can collapse the outline to display only summary tasks, you can expand the outline to display all of the tasks, or you can display the subtasks for some summary tasks, but not for others.

There are carat symbols to the left of the Summary task names. Clicking on these symbols will allow for expansion or collapsing of the wbs. If the carat is black and pointing down (▲), that means all of the tasks are expanded for that summary grouping. If the carat is clear and pointing to the right (▶), the summary grouping is collapsed.

To collapse the schedule outline:

1. Select the desired Summary task.
 2. Click the  to the left of the Summary task.

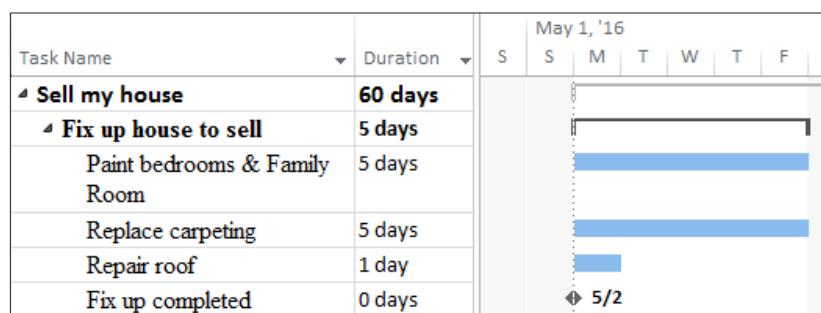

Figure 5-15 Expanded task details

To expand the schedule outline:

1. Select the desired Summary task.
2. Click the plus (+) sign icon to the left of the Summary task.

▷ Clean up House	5 days	
▷ Hire Realtor	5 days	

Figure 5-16 Collapsed task detail

Customizing WBS Codes

The user has the option of customizing wbs numbers using a **Code Mask** and values entered by the user. When this option is evoked, additional options to re-number the wbs, enforce value uniqueness and optimally generate wbsnumbers become available. The customized number values are helpful when managing multiple projects or if there is a need to reference numbers unique to a project schedule. They are also helpful if using templates that result in frequently used task names. These codes could indicate which tasks are members of which project schedules and where the tasks are located within the project schedule.

To customize the wbs numbers:

- Project → wbs button → Define

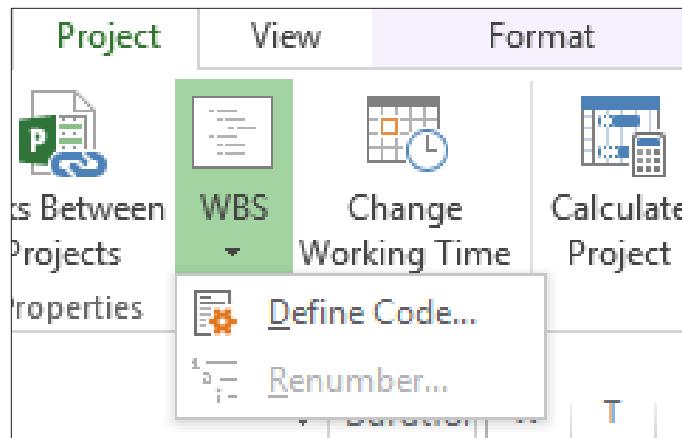

Figure 5-17 wbs define code box

- **Project Code Prefix:** use this value to enter a code that will represent an abbreviation that applies to all wbs for the project schedule.
- **Sequence:** select the data type for the Code Mask to be created (ie: Numbers, Uppercase letters, lower case letters or numbers)
- **Length:** number of values for the length of the value
- **Separator:** Character symbol - . , - + or /

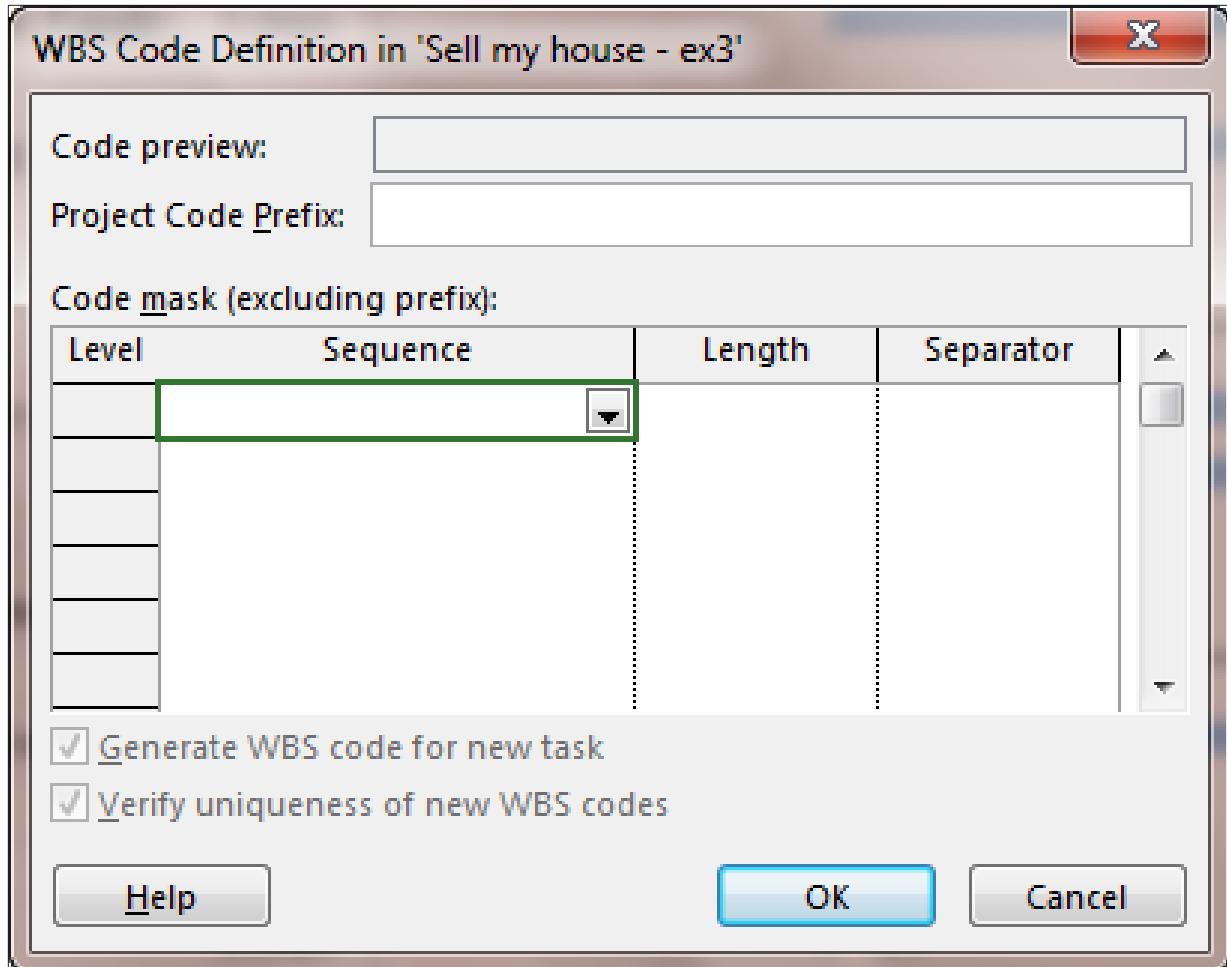

Figure 5-18 Use the above form when defining a customized wbs code for your project schedule

Select as many lines as necessary to create your “Code Mask” and click **OK**

Below is an example of a customized mask for wbs codes:

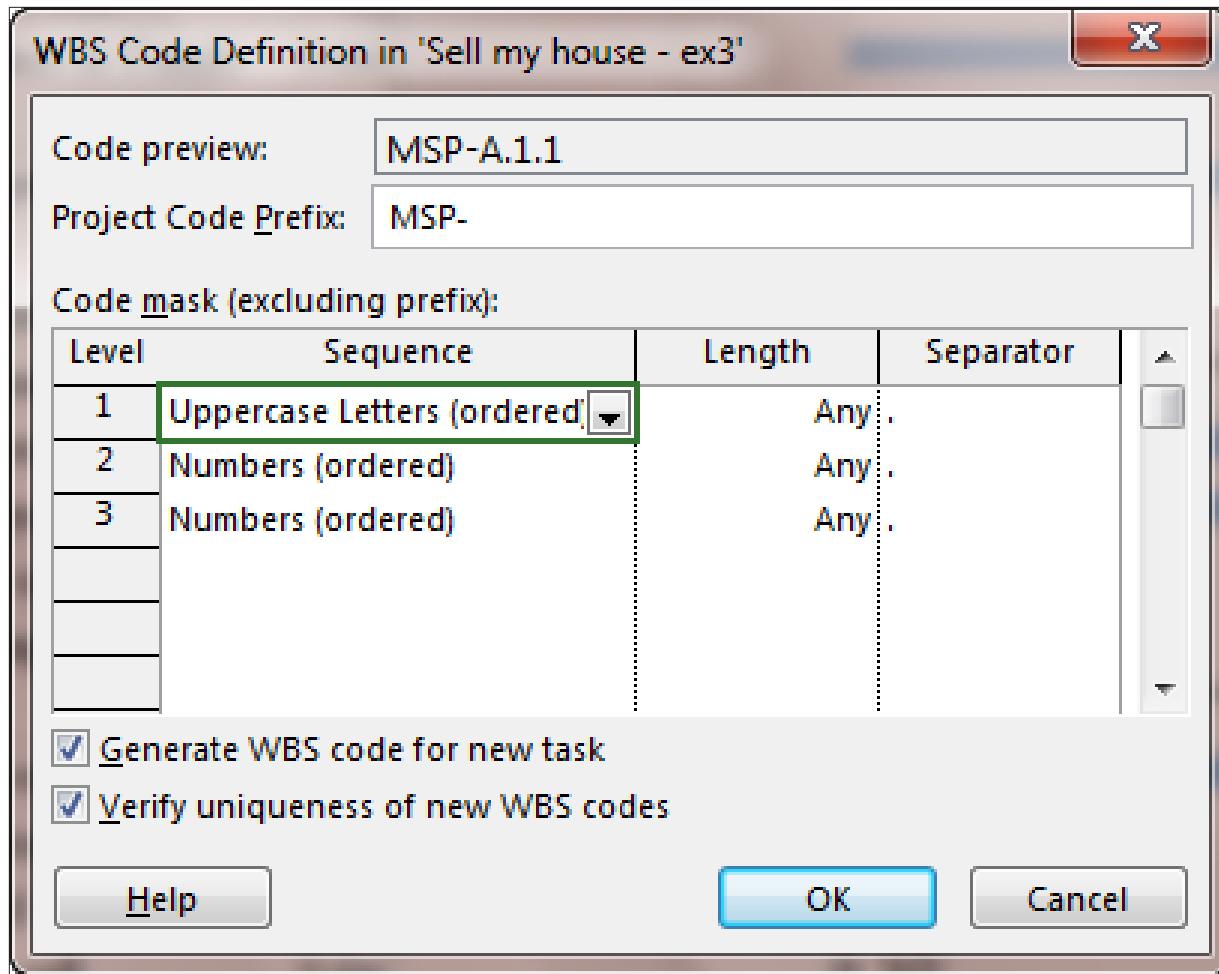

Figure 5-19 Example of customized wbs code mask

Below is the result of the customized wbs values:

		WBS	Task Name	Start	Finish	Baseline Start
0		MSP-	Software Development visual reports	1/16/13	7/5/13	1/1
1		MSP-A	Scope	1/21/13	2/19/13	1/1
2		MSP-A-1	Determine project scope	1/21/13	1/25/13	1/1
3		MSP-A-2	Secure project sponsorship	1/25/13	2/5/13	1/2
4		MSP-A-3	Define preliminary resources	2/10/13	2/19/13	1/3
5		MSP-A-4	Secure core resources	1/21/13	1/29/13	1/1
6		MSP-A-5	Scope complete	2/19/13	2/19/13	2/1
7		MSP-B	Analysis/Software Requirements	2/15/13	3/19/13	2/1
8	✓	MSP-B-1	Conduct needs analysis	2/15/13	2/28/13	2/1
9	✓	MSP-B-2	Draft preliminary software specifications	3/1/13	3/6/13	2/1
10	✓	MSP-B-3	Develop preliminary budget	3/6/13	3/11/13	2/1
11	✓	MSP-B-4	Review software specifications/budget	3/11/13	3/12/13	2/2

Figure 5-20 Display of view containing customized WBS values

When a **Code Mask** is created, the options to **Generate a new WBS** for a new task and **Verify uniqueness of new WBS codes** become available.

To renumber the tasks based on the mask values:

- Project → WBS → Rerumber

Rerumbering may be applied to selected tasks only or the entire project.

Be aware:

To remove a mask: delete lower level entries first and work upwards to higher levels.

After removing the mask, the WBS will not revert back to an unformatted state but will remain as the settings for the customized mask.

If WBS values are turned on as part of the task name the original non-formatted value appears and not the customized value. To turn on the WBS value as part of the task name:

From the Gantt Chart click: View → Outline number

The WBS numbers are shown below included with the task names:

WBS	Task Name	Duration
MSP-	▫ Sell my house	60 days
MSP-A	▫ 1 Fix up house to sell	5 days
MSP-A.1	1.1 Paint bedrooms & Family Room	5 days
MSP-A.2	1.2 Replace carpeting	5 days
MSP-A.3	1.3 Repair roof	1 day
MSP-A.4	1.4 Fix up completed	0 days
MSP-B	▫ 2 Clean up House	5 days
MSP-B.1	2.1 Clean out storage space	5 days
MSP-B.2	2.2 Clean up house	5 days
MSP-B.3	2.3 Hold garage sale	2 days
MSP-B.4	2.4 Clean up completed	0 days
MSP-C	▫ 3 Hire Realtor	5 days
MSP-C.1	3.1 Interview several realtor	5 days
MSP-C.2	3.2 Review contract	3 days
MSP-C.3	3.3 Realtor Hired	0 days

Figure 5-21 wbs numbers included as part of the task name

Guidelines for Creating a WBS

By following some guidelines for creating your Work Breakdown Structure, you can achieve a more effective and manageable project schedule. The WBS's purpose is to help manage a project schedule. When created without guidelines, the project schedule is in danger of becoming another project.

- The WBS is not a to-do list. Are you managing tasks or are you managing a to-do checklist? Usually, tasks or deliverables are entered into the project schedule. Checklists or Work Breakdown Structure dictionaries which contain more detail of how to accomplish the tasks are kept in another location such as a Word Document, Excel Workbook or SharePoint list.
- Identify deliverables within the WBS. Work from deliverable to deliverable in the development of the schedule.
- Break the deliverables into assignable work. When the task is at too high a level, establishing the work, assignments, order and relationships between tasks becomes more difficult.
- Establish a standard design for each section of work. An example of this would be:

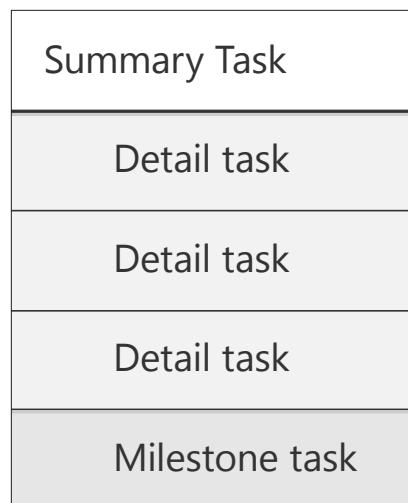

Figure 5-22 Standard design example

Using this format will allow for creating high level reports (Milestone reports) easily as well as moving sections of deliverables around easily.

- A naming standard for naming tasks is helpful and establishes consistency:
 - **Summary tasks:** these names should be nouns that describe the work to be completed in the section of work.
Examples: Location, Network design, Clean-up, Foundations, Development, Requirements, Training, Pilot, Unit Testing
 - **Detail tasks:** should be action verbs and a noun which describes the work that is to be completed for the task.
Examples: Build test database, Review requirements, Develop preliminary budget, Create training materials, Modify code
 - **Milestones:** should be used as goal dates within a project schedule. Naming standards for milestones should be past-tense adverbs.
Examples: Development completed, Vendors contracted, New Facility Opened, Software selected, Integration testing completed
- Every summary task should have at least two subtasks. Detail tasks and milestones can be in the WBS without being part of a summary task grouping.
- Establish maximum and minimum lengths of duration for tasks. Create a rule of thumb based on the length of each project. For example: If you have a 6 month project no task should be less than 1 day and no task will be longer than 2 weeks. Use the rule as a guide for estimating task lengths. If tasks are too long, break the work down further.
- Decide if you will be creating a WBS in the rolling wave approach. The rolling wave approach is used for schedules managing software development or any schedule where all of the details of the project are not known at the beginning of the project. Consider creating place holders for future phases of the project and elaborate the work one phase at a time.
- Deliverables: Completing a section of work means that the deliverable of that section has been accepted. Create a task for the delivery of the deliverable and create a milestone to represent the acceptance of the deliverable. The two are rarely occur at the same time.
- Level of detail. The WBS may contain as many levels of detail as you need but best practices suggest that the higher the level number the more complex the schedule becomes. Recommendations suggest that the detail is manageable using five or less levels.

- If too much detail is put into the project schedule, the schedule will become a project unto itself. The more tasks, the more work.
- Use the WBS to help manage the scope of your project. If the task isn't in the project, consider it out of scope. When you enter tasks into the project schedule, ask yourself if the task is necessary.
- When planning the WBS think about just the work of the project. Many project managers like to start thinking about who will do the work and when. It is a good idea to focus on the work of the project only and think of the work as the "what" of the project. The "who" and "when" will come as the project schedule develops.
- Having the project team or the top level resources help build the WBS for a project is a win-win for the project:
 - Increases resource buy in
 - Encourages resource contribution
 - Many eyes looking at problems from different angles
 - Less probability of missing tasks
 - Encourages team building

Milestones

A milestone is a check point in your project. It is a status, not a task which means that it has no duration and no resources are needed. For example, an approval or sign-off before the project can proceed and the completion of a stage of the project are both milestones. To Project, a milestone is a task with a zero duration.

To enter a milestone, use the following steps:

1. Insert a new task, or click the Task Name of a blank task.
2. Type the name for the milestone in the **Task Name** field and press the **Tab** key.
3. Type “0” in the Duration field, and press the **Enter** key.

Milestones are denoted in the Gantt Chart as a diamond symbol, rather than a bar (since the milestone has no duration).

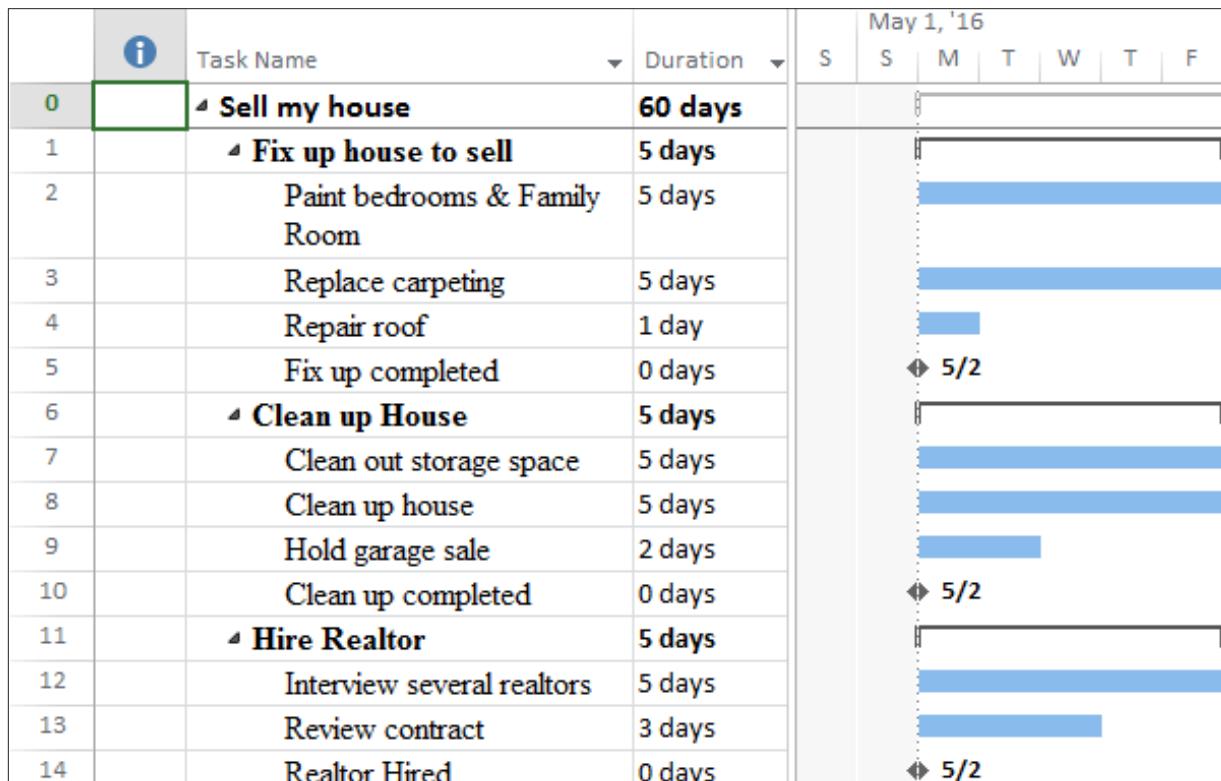

Figure 5-23 In this view tasks 5, 10 and 14 are milestones. They have a zero duration and a milestone icon on the Gantt chart.

Manual vs Automatic

Project 2013 provides two scheduling methods for creating project schedules. The methods are the traditional or automatic scheduling and manual scheduling.

Traditional or automatic scheduling

This scheduling method was used in prior versions of ms Project and is contained in Project 2013. After tasks are entered relationships or dependencies are created between the tasks. The task durations with their relationships established the timeline for the schedule. This scheduling method allows for bottom up scheduling where the sum of the detail tasks establishes the time line for the project.

Manual scheduling

Manual scheduling allows for top-down scheduling where summary tasks may be added first and the details of the project work is completed later. It also permits more unknowns during scheduling process and the ability to complete the details when known. Tasks do not have to contain relationships and scheduling dates may be entered.

Project scheduling mode will be selected on a task by task basis. Manually scheduled tasks and automatic scheduled tasks may be mixed within the same project schedule. Each task will contain a column called **task mode** which will establish the scheduling mode assigned to a task.

When to Use Manual vs. Automatic Scheduling

Manual vs. automatic scheduling usage will deliver very different results. The amount of information concerning the project that is available to the scheduler when the schedule is created might lend the scheduler to select one method over the other when creating the initial schedule. It may be advantageous to use both scheduling methods within a schedule switching between scheduling methods when needed.

Use Manual scheduling when

- Minimal information is available about the project and you need to put your ideas (tasks and durations) into an initial schedule.
- Tasks are assigned to specific dates and you are not comfortable with the schedule moving as other tasks are entered or as resources are assigned.
- Using top-down planning – entering duration values for summary tasks followed by detail tasks and milestones to complete the work of the summary tasks.
- Using free form planning of tasks and durations to produce a Gantt chart.
- Need to build a rough schedule for a future project
- Relationships between tasks are not known.

Use Automatic scheduling when

- More complete information is known about the goals of the project.
- Using bottom up planning. Enter the summary tasks and create WBS structure. The detail tasks within the summaries will calculate the duration of the summary tasks.
- You want the schedule to be dynamic. Tasks will be adjusted reacting to changes within the schedule.

- You want the scheduling engine to calculate dates in the schedule.
- Resource allocations, resource assignments based on hours, earned value and more accurate metrics are needed.

Consider using a combination of both methods when

- Initial planning may be in manual mode. As decisions are made and more detail is known, tasks may be converted to automatic mode.
- Consider converting to automatic mode when project execution begins. This may be done for the entire project, by phase or range of tasks.

Project Live Cycle Approach

Change to Auto Schedule

The column or field in Project 2013 that determines which scheduling mode a task will be scheduled by is called “Task Mode”. By default, you will see this field on the Entry table of the Gantt Chart. This column may be added to any task table.

Setting the automatic or manual scheduling mode may be accomplished in several ways:

To set the scheduling mode for a project or for all future projects:

- **File → Options → Schedule**

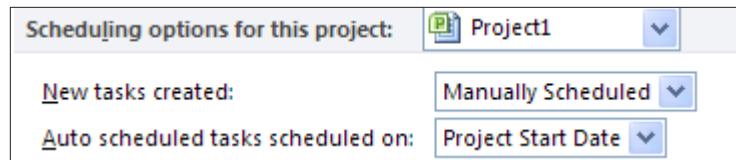

Figure 5-24 PLACEHOLDER

After several tasks are entered you may decide to switch to a different scheduling mode for the addition of future tasks for the project. This can be done quickly using the choice option at the bottom left hand corner of the Gantt Chart view which is shown below. Changing this option will not affect existing tasks in the schedule; it will only affect future added tasks. Click on the button highlighted below for the option to change scheduling modes:

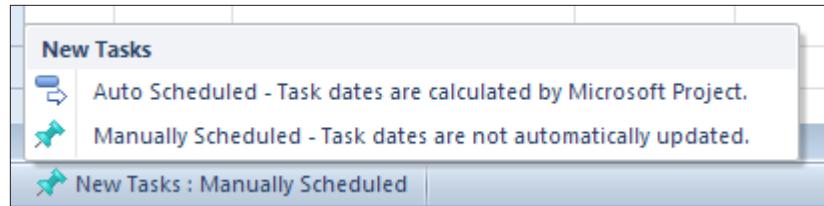

Figure 5-25 PLACEHOLDER

The default Entry Table for the Gantt Chart includes the “Task Mode” column inserted to the left of the Task Name column. This column may be inserted into any table as needed.. The indicators in this column indicate the scheduling mode for the task. In the view below the automatically

scheduled tasks have a icon and the manually scheduled tasks have a icon in the Task Mode column. Hover your mouse pointer over the icon and the scheduling mode description will appear. Clicking on the icon will allow for scheduling mode changes per task. Note the different Gantt bar formats for manual v automatically scheduled tasks.

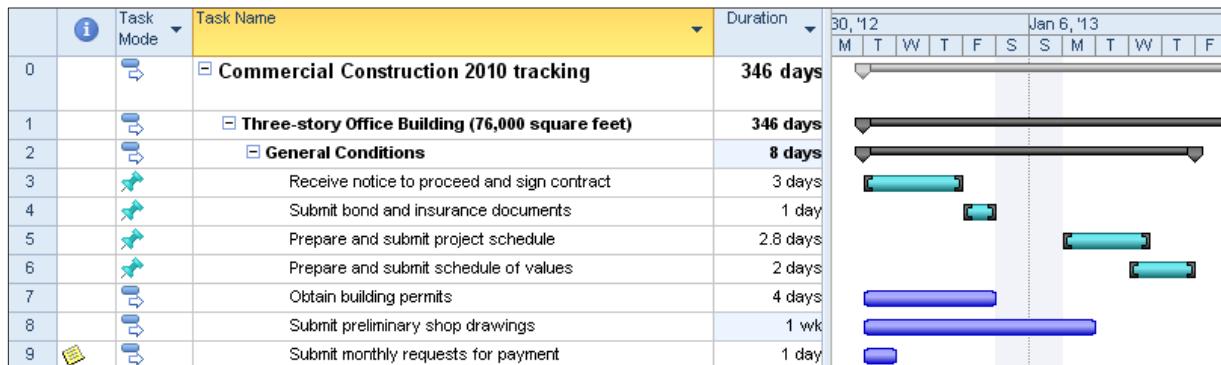

Figure 5-26 PLACEHOLDER

To change the scheduling mode from the Task ribbon:

- Click task to be changed
- Click **Task → Manual Schedule or Automatic Schedule**

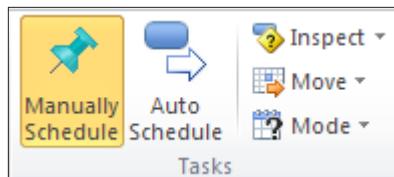

Figure 5-27 PLACEHOLDER

Another way to change the scheduling mode is to double clicking a task to open the Task Information dialogue box. An option is located on the General tab to change the scheduling mode. The options are highlighted in the view below.

Chapter 6

Estimating, Linking and Lead and Lag

Overview of Estimating

Estimating is the ability to make an educated guess as to the duration, work or duration and work of a task. It is an art to know how long a task will take and how many resources are required and of what skills are required for a task.

How Project 2013 Defines and Calculates Work and Duration

It would be helpful to understand the formula that will be driving the scheduling of the tasks before you enter your estimates:

$$\text{Work} = \text{Duration} * \text{Units} \text{ (quantity of a resource)}$$

OR

$$\text{Duration} = \text{Work} / \text{Units} \text{ (quantity of a resource)}$$

Estimating Techniques

- **Top down estimating:** used when performing the same types of projects frequently. Top-down estimating allows for estimating the length of a phase. The details for tasks will follow. Manual scheduling mode in Project 2013 allows for this type of estimating model.
- **Bottom up estimating:** estimating each task work package or deliverable of the project (this could be at the task level) will allow for the accumulated roll up of the values to create the length of the project. The roll up will accumulate at the summary task levels as totals for

duration, work and cost. In turn, the summary tasks will roll up to the project summary task for a grand total for the project.

What to Estimate?

- Estimate duration (length of time) in minutes, hours, days, months, etc.
- Estimate work (amount of work) in minutes, hours, days, months, etc.
- Estimate duration and work in minutes, hours, days, months, etc.

Where Do the Estimates Come From?

Estimates may come from the project manager, team members, subject matter experts, stakeholders, historic data, experience, etc.

How Do You Get Good Estimates?

Ask the right people: look for the most experienced person in a specific skill area. Chances are, they have worked a project similar to or have actually performed the work in the past. These types of people can be invaluable to a project manager for estimating.

Ask the performing resource: if you are lucky enough to know who your resources will be for the project, the performing resource is always the best source for an estimate. However, how you ask the resource for

the estimate will make a difference. If you ask for an estimate, most people are thinking about fitting the work into their current workload. Framing the question from the point of view that the project will be worked some time in the future will result in a more accurate response. They should only consider how long (or how much work) it would take to perform the task regardless of the specific timeframe.

Ask more than one person: seeking various points of view for estimates will help define what the best estimate is. Project 2013 has an add-in feature called **PERT** which allows for 3-point estimates for task durations. The 3 points are pessimistic, most likely and optimistic. These values are feed into a formula that will result in an estimated duration of a task. The result will be three Gantt Charts: Pessimistic, Optimistic and Most likely.

Subject Matter Experts: always a good source for advice.

Padding, slack, and time reserve should be included in any schedule. Every organization and project management methodology has its own approach. The important point is that extra time should be built into all schedules to help manage the inevitable contingencies that will occur during the performance of all projects. If padding, slack or time reserves are not included in the planning, the schedule will not be realistic and will result in a reduced probability of completing the project as planned.

Entering Estimates

The Entry table of the Gantt chart is designed for easy entry of task estimates. Adding the work column to the view will enable adding Work estimates.

To insert the work column in to the Entry table of the Gantt Chart view:

1. **Tasks → Gantt Chart** (the default value will be the Entry table)
 2. Right click on the column heading **Start**
 3. Select Insert Column
 4. Click on the “W” key on the keyboard
 5. Click on **Work**
 6. Click ok to close the box
- For each task enter:
- A duration value

- A work value
 - A duration and a work value
- Valid entry values:
- 1m = 1 minute
 - 1h = 1 hour
 - 1d = 1 day
 - 1w = 1 week
 - 1mo = 1 month
 - 1y = 1 year

Abbreviations of the time values may be customized in the Schedule options:

File → Options → Schedule

Duration entries will be scheduled as work days as defined by the project calendar.

Physical days (actual day count including non-working days) may also be achieved by using the **Elapsed** time. By placing an “E” in front of the letter in the duration field, the value will be scheduled in physical number of days. For example: 13 ed = 13 physical days.

In the example below, Task 1 is scheduled as business days (using the project calendar) and Task 2 is scheduled as physical days. Note the scheduling difference:

	i	Task Mode	Task Name	Duration	Start	Finish		Jul 7, '13	Jul 14, '13													
							4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19
1		➡	Task 1	10 days	7/5/13	7/18/13																
2		➡	Task 2	10 edays	7/5/13	7/15/13																

Figure 6-1 PLACEHOLDER

Other helpful information:

- When task durations are entered, a “?” will be added within the duration field. This “?” represents that the task information has not been finalized and considered estimated. This indicator is optional and may be turned off at **File → Options → Schedule** and un-checking the following options:
 - Show that scheduled tasks have estimated durations
 - New scheduled tasks have estimated durations

- Some project managers plan all tasks in fixed duration. It should be noted, that fixed duration tasks will be tied to calendar dates and might be more difficult to schedule and track in the future.
- Manual scheduling mode for a task has the benefit of not requiring values in duration, start and finish columns. Text may be added as a note to the scheduler. If the task mode is changed to automatic scheduling, the text will be lost and, the software will enter a valid values. Scheduling modes are discussed in *Manual vs Automatic* on page 107. In the view below note the values in the duration, start and finish columns for Task 2:

		Task Mode	Task Name	Duration	Work	Start	Finish	
1			Task 1	10 days	0 hrs	7/5/13	7/18/13	4
2			Task 2	ask Bob	0 hrs	unsure	future	

Figure 6-2 PLACEHOLDER

Inserting **Effort-driven** and **Type** columns will allow for setting these values for each task as well. As discussed in Chapter 4, *Start a Project*, each task will be unique in the nature of the work to be performed. As a result, these settings should be adjusted to determine what task type and effort-driven values are appropriate for a task.

Estimating for Unknown Resources

Most project managers plan the work for a project and find out what specific resources will perform the tasks in the future. Tasks might require a specific skill level but the quality of the unfamiliar resource is unknown. How do you plan for unknown resources?

When estimating tasks, consider estimating a task for a senior level resource or a junior level resource:

- The senior level person would accomplish the task faster and would cost more.

- The junior level resource would cost less but needs more time and training.

Outsourcing resources: although there is a quantity of highly qualified contract resources, the recommendation is to estimate these tasks at the junior level. You will need to account for learning curve, assimilation into your organization and ramp up. The project manager might request a specific skill level but it is unknown whether or not that skill will be available when the project requires it.

As mentioned earlier, the PERT estimating method could give a 3 point duration estimate. Using PERT will result in 3 different reports; an optimistic Gantt Chart, a pessimistic Gantt Chart and an expected Gantt Chart. The PERT estimating module is an add-in in Project 2013 and is available at no cost as a download from Microsoft.

Add Elapsed Time

Duration, Work, or Duration & Work

Types of Durations

Concept of the Scheduling Engine

Dynamic scheduling is the use of task relationships and dependencies to drive the sequence and ultimately the timing of the schedule. Project's scheduling engine support dynamic scheduling.

This means that as you make adjustments to certain tasks as the project progresses Project automatically recalculates the effect on subsequent tasks. This will also show the project manager if the overall schedule is extended and provide analysis opportunity to monitor if the change creates multiple critical paths, potential resource constraints, and so on.

Project will also highlight those tasks affected by a change so the project manager can easily see the ripple effect of the current proposed task changes. With the 99 levels of undo in Project 2013, a project manager can also utilize this highlighting feature to conduct Monte Carlo, or What If, analysis to analyze multiple scenarios of task adjustments to the schedule.

If constraints are utilized to lock in task dates this disables Project's built-in scheduling engine and a project manager will not be able to see the effects downstream in the schedule. Maintaining this dynamic visibility is vital in effectively and proactively managing a schedule. This is why it is a best practice to not use constraints, unless necessary and appropriate to the task.

Linking

Task Dependency Types

Project 2013 allows for 4 types of task dependencies. These dependencies establish the order that the tasks will be performed. Dependencies may also be referred to as links, relationships or relationships between tasks. The result of creating task relationships is a network of related tasks establishing a time line. When referring to linked tasks the following terms will apply:

- A task that has a relationship directly before a task is known as a predecessor task
- A task that has a relationship directly after a task is known as a successor task

In the view below there are 4 tasks. The relationships are established as link lines between tasks.

- The predecessor task or task that comes before Task B is Task A.
- The successor task or task that comes after Task B is Task C.

Pointing to a link line between tasks will reveal information regarding the relationship between tasks. See the highlighted box below which is showing the details of the relationship between Task C and Task D.

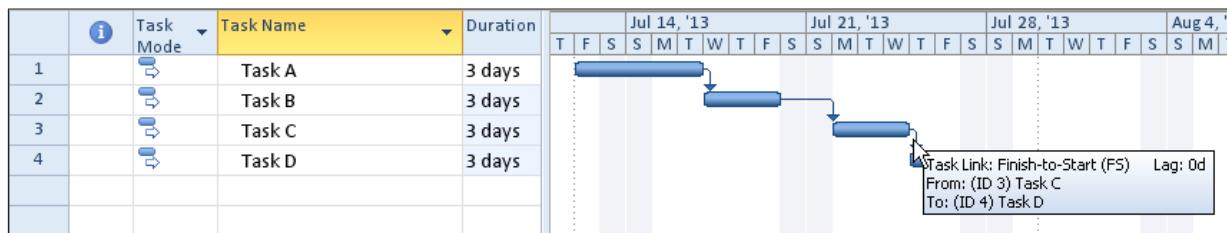

Figure 6-3 PLACEHOLDER

Not all dependencies are the same. Some tasks will start at the same

time where others might be schedule one after the next. To facilitate scheduling needs, there are 4 dependency types which are:

- Finish-to-start
- Start-to-start
- Finish-to-finish
- Start-to-finish

The details of each of the relationship types is described below:

- Finish-to-Start (fs)

- Default dependency for the Project 2013
- Task 1 must complete before Task 2 can begin
- This relationship type creates a waterfall effect
- Example: Drive to the restaurant, then eat dinner
Build a wall then paint the wall

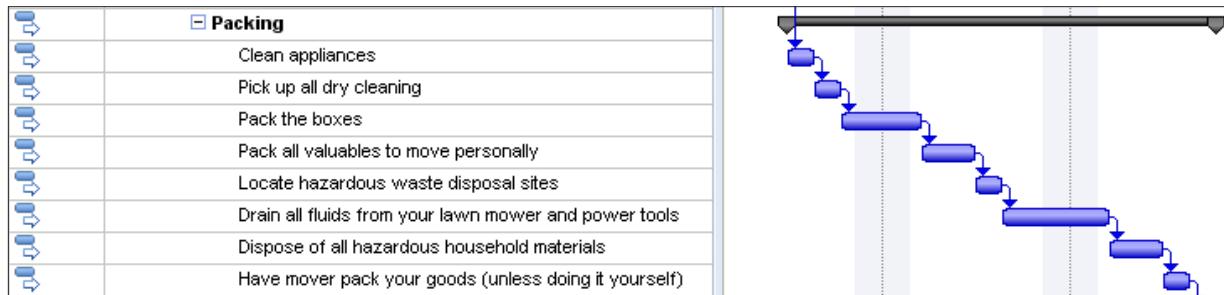

Figure 6-4 PLACEHOLDER

- Start-to-Start (ss)
- Tasks that are scheduled to start at the same time
 - Example: After the moving expenses are calculated, then determining the best moving method, create a moving-expenses file and create a moving binder may all start at the same time. All 3 tasks should be completed (in this example) to pass the milestone and move on to the next section of work. It should also be noted that the 3 tasks that are starting at the same time are not scheduled to complete at the same time. As a result, the longest task will determine when the milestone will be scheduled.

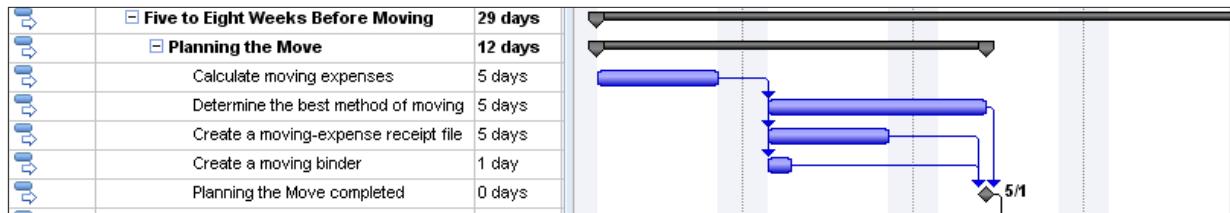

Figure 6-5 PLACEHOLDER

- Finish-to-Finish (FF)
 - Tasks that are scheduled to finish at the same time but not required to start at the same time.
 - Example: The section of work below can all start when the previous section is completed. These tasks will start at different times, but they all need to be completed by the same point in time.

Figure 6-6 PLACEHOLDER

- Start-to-Finish (SF)
 - The start date of the predecessor task will determine the finish date of the successor task.
 - This is the least used dependency type and rarely used.
 - Example: When the new software module comes on line, the old software will be taken off line

When working with manually scheduled tasks, errors might result using dependencies. A warning is viewed when tasks are linked and dates are entered into the start or finish columns. The calculation of the project duration might not match the duration calculated when the entered dates are taken into consideration. Below is an example of an error created when a date was entered in the start column for Task B. The error is represented by the red line under the incorrect date and the dots around the Gantt bars.

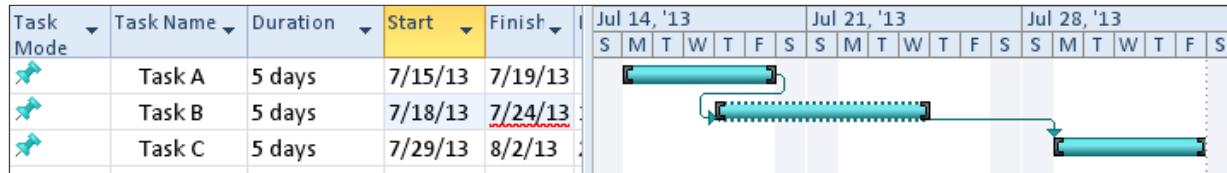

Figure 6-7 PLACEHOLDER

To correct this type of error, Project 2013 has a new feature called Respect Links. Right click on the red error line and following choices appear. Select the Respect Links option and the date will be recalculated based on the task relationships.

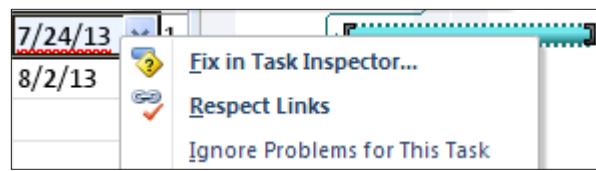

Figure 6-8 PLACEHOLDER

Below is the result of clicking on the Respect Links option for the task. Note the error message is no longer visible and the task in error has been rescheduled.

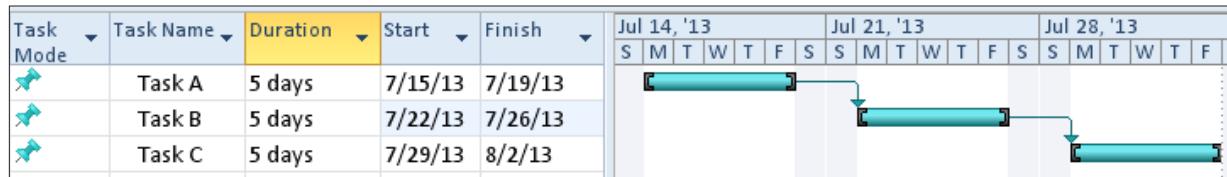

Figure 6-9 PLACEHOLDER

Best Practices for Using Dependencies

Project 2013 calculates the duration of a project based on how task dependencies are created between tasks. Establishing the order of the tasks is called Sequencing. Sequencing is concerned with establishing the order tasks should or could be performed. Arranging tasks in the most efficient order for the project is not an easy exercise. Sometimes, the order of the tasks is very evident and at other times, more complicated. Sequencing is more option than right or wrong for a project.

For example, the following tasks are tasks that someone would do when they come home after work and before they go to bed:

1. Arrive Home
2. Eat Dinner
3. Walk the dog
4. Run an errand
5. Read the mail
6. Clean up the dinner dishes
7. Cook dinner
8. Go to Sleep
9. Get the mail
10. Watch the news

Take a minute to write down the numbers of the tasks above in the order you would perform these tasks.

Things you might notice:

- You will have some forced relationships:
 - You can't eat dinner until you make dinner
 - You can't read the mail until you get the mail
- You will also notice that Arrive Home and Go to Sleep are the start and finish of the sequence.
- Some tasks can occur at any time and are not dependent upon another tasks
- Some tasks you might consider doing differently, like picking up dinner on the way home. It would accomplish the same purpose and save time.
- Can any tasks be done at the same time as other tasks to save time?
- Should any tasks be eliminated?

Next rework this same sequence of tasks knowing that someone else will help perform the tasks. Does it turn out differently? Would it take less or more time? Some tasks you have to do yourself and some tasks can be performed by someone else.

Best practices to consider when creating dependencies:

Relationship between tasks will allow you to create network of related tasks. The network will show order the tasks will occur. Below are some best practices which should be considered when creating relationships:

- All tasks should have both a predecessor and a successor. The timeline for the project is based on this concept. If tasks are not linked in the network of tasks, their duration will not be accounted for within the timeline. Making sure all task durations are accounted for will avoid surprises at the end of a project.
- When creating dependencies or relationships, apply the rule – because I can, is it a good idea? Do not link every task to every other task. In the example above, should you should have linked Arrive Home with Go to Sleep with the logic of if you don't come home, you can't go to sleep? The answer is no. Only the last task that is completed before Go to Sleep should be linked to Go to Sleep.
- Think about what task pushes or influences another task. If a task is late, what other tasks will be affected? Link only tasks with a direct affect on a successor task. Ask yourself what needs to be completed before you can do the next step and if it is late, which tasks will be affected.
- Link detailed tasks and milestones only. The completion of tasks will push the milestones or the short term goals. Linking summary tasks means that an entire section of work must be completed before the next section may be started. Ask yourself if that is true for your situation before linking at the summary level. Linking summary tasks is not recommended.
- Tasks should always be linked to push milestones. For example: define what the definition of “project completed” is. The multiple parallel paths that must be completed to conclude the project should all be linked to the ending milestone. If any of the parallel paths take longer than planned, the milestone date will be pushed out in time.

In the example below “Start the Project” is the starting milestone. The next 3 sections of work all start when the project starts. All 3 sections must be completed before the house is ready to sell. If any of the sections take longer, each section has the ability to push the ending milestone or when the house is ready to sell. The longest of the parallel

paths will be considered the critical path or the section that determines the timeline of the project.

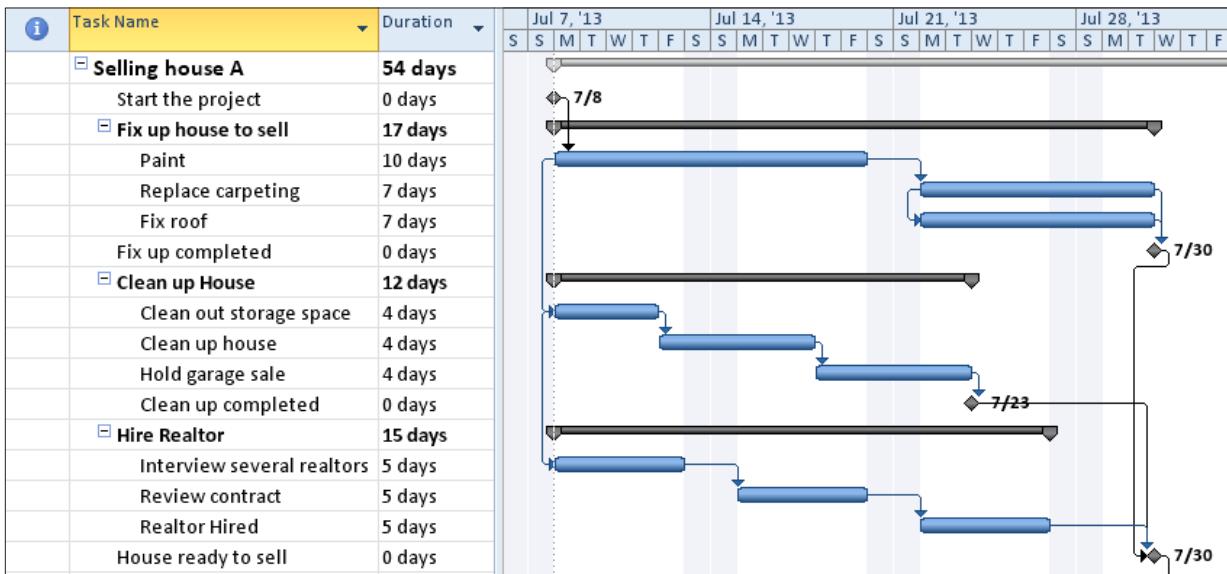

Figure 6-10 PLACEHOLDER

- Create as many parallel paths as possible to shorten the schedule. Use of the Start-To-Start and Finish-To –Finish relationships will help create parallel paths and shorten the project time line. Be aware, however, just because you can schedule tasks in parallel, you might not have the resources to perform the work and which could extend the timeline.
- Do not link tasks based on a resource. Some people will plan tasks to occur at specific times because they think that a resource will be available at that time. Chances are the expected resources will not be available at the planned point in time because other tasks for that resource have changed. Plan the schedule for the work required and plan/arrange for required resources as the time draws nearer to when the task will be performed.
- Links may be external to the project. Project 2013 will allow dependencies to exist in other projects that are linked to tasks in your project. This is similar to links in Excel. In Excel, if links between files are created and the files are relocated, the links will be broken. Project 2013's links between project files will work the same way.

Project 2013 also offers the option for tasks that are moved or added to the schedule to automatically link in a Finish-to-Start relationship or not be linked at all. This is a personal preference and may be applied to a specific project or all projects viewed on your desktop.

To view or change this option: **File → Options → Schedule**

Figure 6-11 PLACEHOLDER

Lead & Lag

Relationships between tasks are not always absolutely defined as described with relationships. Allowing for Lead and Lag time will help refine a schedule to bring it more in line with the actual timeline for the project. Lead and Lag time will allow for wait time between tasks and overlap of task activities.

In this Lesson we will discuss:

1. What is Lag time?
2. What is Lead time?
3. Best Practices for using Lead and Lag time

What is Lag Time?

Lag time is used to provide wait time between tasks. The time will be expressed in business days or valid project calendar working time. Lag time should be used to extend the timeline of the project when only duration needs to be added to a schedule and will not add work or cost. For example: New concrete is poured and you must wait 6 days before you can drive on it. The time must occur but no work or cost is added to the task. A dependency must first exist between tasks before Lag time can be created.

To create Lag time:

Double click the relationship line between tasks where you would like to add the lag time. The task dependency dialog box below will appear. In the illustration below, we see that there are 2 tasks. After the equipment is ordered there will be a 2 week delivery wait time before the equipment is received. To create this wait time, set the Lag field to 2w (2 weeks). Click OK.

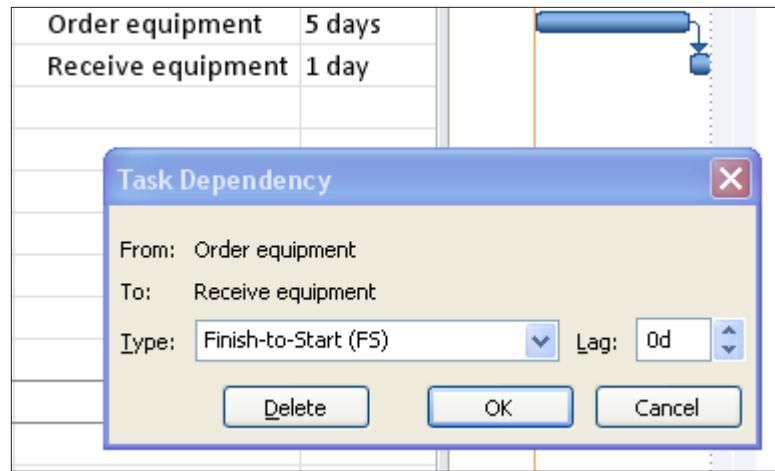

Figure 6-12 PLACEHOLDER

The result is of adding a 2 week lag shown in the illustration below.

Figure 6-13 PLACEHOLDER

An alternate method of entering lag time is by adding the value of the lag into the predecessor column as shown below:

Task Name	Duration	Predecessors	0	Mar 21, '10	Mar 28, '10	Apr 4, '10
Task Name	Duration	Predecessors	F	S	T	T
Order equipment	5 days					
Receive equipment	1 day	1FS+2 wks				

Figure 6-14 PLACEHOLDER

Lag time may also be expressed as a percentage of the duration of the predecessor task. Order equipment is a 5 day task. 50% Lag would mean that the length of the lag time would be 2.5 days or half of the 5 days duration of the Order equipment task.

What is Lead Time?

Lead time shortens the time line of the project. Consider tasks that do not need to be 100% completed before the successor task can start. Lead time is a good tool to help refine the schedule when trying to cut time from a timeline. Project 2013 does not have a field or box called Lead time. Instead, to create Lead time negative Lag time is entered.

To create Lead time:

The diagram below allows 10 days to unpack equipment and 10 days to set up the equipment. The same resources are performing both tasks. The 2 tasks together will require 20 days to complete if the equipment was set up after all of the equipment has been unpacked. If you had more resources to work on the tasks could you get these tasks accomplished quicker? In the example below the task to set up equipment will be scheduled to start when the equipment is half unpacked.

Below is a view of the tasks before lead time is entered. The tasks are scheduled for 20 days of duration.

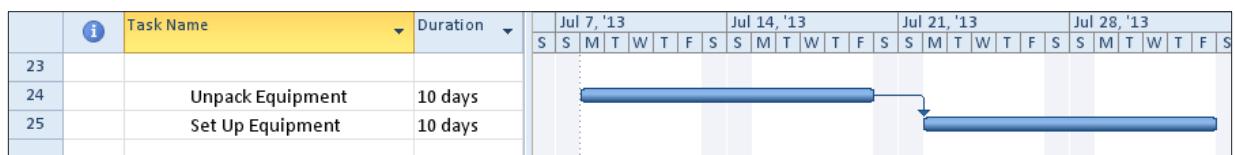

Figure 6-15 PLACEHOLDER

To enter Lead time between two tasks:

- Double click the relationship line between tasks where lead time is to be added.
- Enter “-5days” in the Lag field value
- Click OK to close the box

The task dependency dialog box shown below will appear.

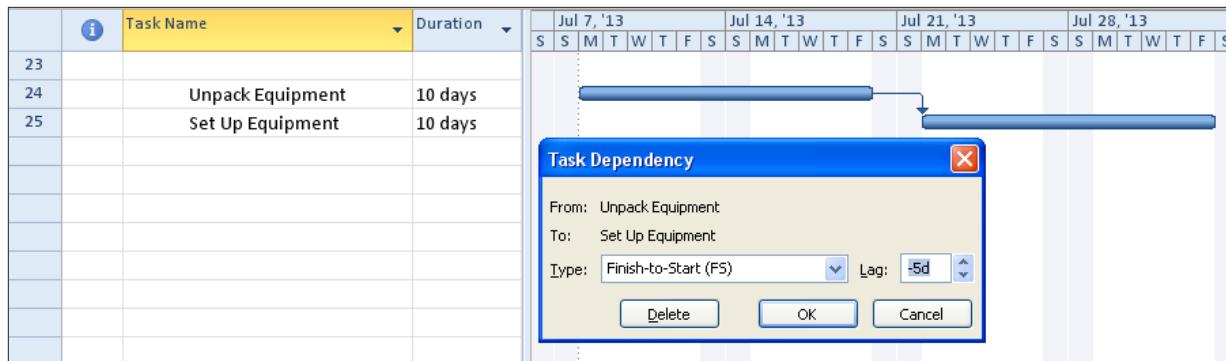

Figure 6-16 PLACEHOLDER

Below is the result of adding lead time between two tasks. Note the overlap of tasks and the total scheduling time has been shortened.

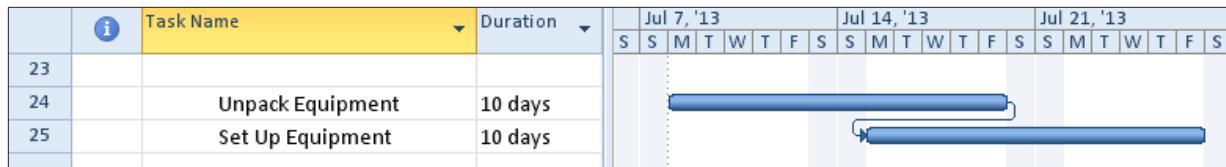

Figure 6-17 PLACEHOLDER

Lead time can also be expressed in percentages. The advantage to using percentages is if the predecessor task length changes, the successor task will automatically adjust its starting date.

For example:

- Task A is 10 days long and has a Finish-to-start relationship with Task B with -50% lead time
- Task B will be scheduled to start when Task A has 5 days of work completed
- Task A is taking longer than expected and is now scheduled to take 15 days
- Task B will be rescheduled to start when Task A has 7.5 days of work completed.

A -50% would move the successor task to the left 50% of the duration of the predecessor task. The diagram below demonstrates the result of applying -50% for Lead time to the relationship between these two tasks.

To enter Lead time between two tasks as a percentage value:

- Double click the relationship line between tasks where lead time is required.
- Enter “-50%” in the Lag field value
- Click ok to close the box

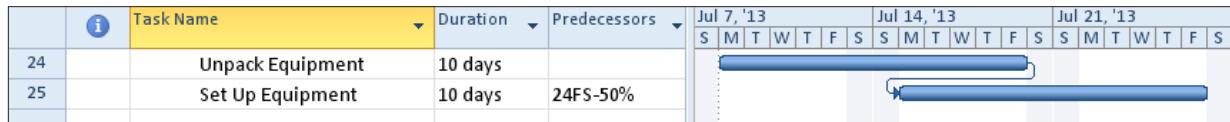

Figure 6-18 PLACEHOLDER

Best Practices

Use Lag time when extending the timeline without adding cost or work to the project.

Best practices for the use of Lag time in a project schedule:

Time must go by without a work or cost applied to the time. Lag is considered to be wait time like a delivery of equipment or concrete hardening

Adding slack into the schedule to extend the timeline to allow for possible contingencies

Adding wait time between phases of a project

Adding wait time between parallel sections of a project to allow others to catch up

Lag time may also be expressed in elapsed time to allow nights and weekends to be included

Planning the work for a factory crew. For example: the crew needs to be at work for 9 hours but 8 of that is actual work. The remaining hour is meal and breaks. Use Lag to extend the time for the work of the crew to accommodate breaks.

Use lead time when the schedule needs to be shortened. More resources will be needed to accomplish the tasks. Lead time can increase risk of re-work and could increase cost for tasks.

Best practices for the use of **Lead** time in a project schedule:

Piece work – when X number of items or time has been completed, giving the completed work to the next group to start their work.

Testing – when X percentage of the testing is completed and successful, giving the completed work to the next group to start their work.

When it is not necessary for the predecessor task to achieve 100% completion before starting the successor task.

Inactivate Tasks

When developing a schedule or even after a schedule is being executed, you may have portions of the schedule that may be optional or you may be looking for ways to run a scenario which leaves out a portion of the schedule from the scheduling engine. Choosing to deactivate a collection of tasks is a way to temporarily or permanently remove tasks from the rest of the schedule, but still leave the information about those tasks intact so you can reactivate them at a later time as desired, or keep this inactive data for historical purposes. This feature saves time over having to delete and re-enter task information. All tasks by default are active unless you make them inactive.

This feature is in Project Professional 2013 only.

To deactivate a task:

1. Select the task(s).
2. On the **Task** tab, **Schedule** group, click **Inactivate**.

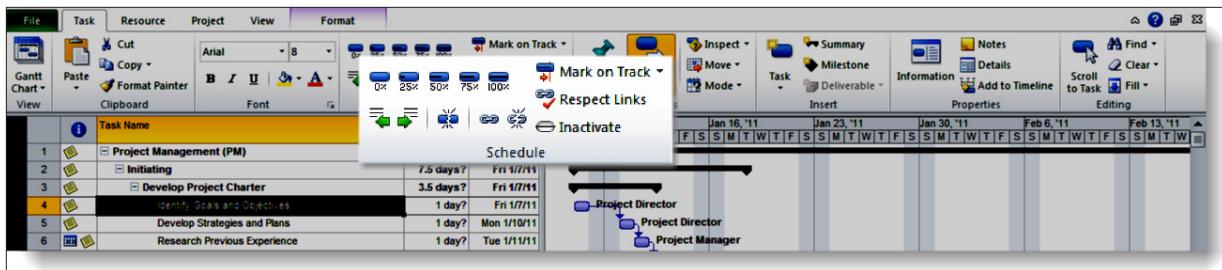

Figure 6-19 Project Ribbon – Inactivate Task

If you made a mistake and accidentally deactivate the wrong task(s), simply click **Inactivate** again to make them active.

This feature is especially useful when you are struggling with test/retest cycles. Simply deactivate the extra cycles until they are needed.

Inactive tasks are a great way to include contingency actions which only apply if a planned risk actually manifests itself in the future.

Chapter 7

Constraints and Deadlines

Constraints

What are Constraints?

Constraints are defined as conditions upon which a project must be managed against which can negatively affect budget, quality, schedule and scope.

Some typical constraints might include a lack of:

- Money
- Skilled resources
- Requirements for the project
- Equipment
- Management support
- Time

Even though the above constraints are important to the success of a project, Project 2013 cannot account for these constraints. However, the constraints Project 2013 can help you with are dates.

Tasks may require a target date or start at a specific date, end at a specific date, or require scheduling at the beginning or ending of a timeframe.

Date constraints can be used to refine the project schedule when greater control is needed for specific tasks start or finish dates. Using date constraints, however, will also remove flexibility from the schedule. It is for this reason that the use of constraints be kept to a minimum. Some of the date constraints are more flexible than others available. The flexible constraints will be the most beneficial during scheduling.

Manual Scheduled tasks can not use constraints. They are used for Auto Scheduled tasks only.

Constraint Types

Constraints are used when a task must be scheduled with a specific date in mind or within a specific time period. When setting constraints, the following pieces of information must be known:

- Constraint type
- Date for the constraint

There are 8 constraint types available in the Project 2013 and all are date dependent:

1. **As Soon As Possible (ASAP)** - default constraint applied to all tasks when a project is scheduled from the project start date. Tasks will be scheduled as early as possible within a timeframe.
2. **As Late As Possible (ALAP)** - default constraint applied to tasks when a project is scheduled from the finish date of the project. Tasks will be scheduled as late as possible within a timeframe.
3. **Finish No Earlier Than (FNET)** - applied to a task that must finish no earlier than a specified date. The constraint date will be applied to the finish date of the task and the task will move forward in time to the date specified for this constraint.
4. **Finish No Later Than (FNLT)** - applied to a task that must finish no later than a specified date. During tracking, tasks will move forward in the schedule. Tasks with Finish No Later Than constraints will move forward and stop at the constraint date.
5. **Start No Earlier Than (SNET)** - applied to a task that must start no earlier than a specified date. The constraint date will be applied to the start date of the task and the task will move forward in time to the date specified for this constraint.
6. **Start No Later Than (SNLT)** - applied to a task that must be started by a specified date. During tracking, tasks will move forward in the schedule. Tasks with a Start No Later Than constraints will move forward and stop at the constraint date.
7. **Must Start On** – applied when a task has a hard start date. The task will move to the constraint date and is fixed on that date.
8. **Must Finish On** - applied when a task has a hard finish date. The task will move to the constraint date and is fixed on that date.

To Add a Task Constraint

Method 1

1. Double-click any cell in the desired task row to launch Task Information.
2. Click the **Advanced** tab
3. In the **Constraint type** drop-down list, choose the desired constraint
4. In the **Constraint date** field, enter or choose the desired date (optional)
5. Click **OK**

If the planning wizard appears because you are creating a constraint on a task with a link to another task, you must select: **Continue. A xx constraint will be set.** Any of the other choices will alter or cancel the constraint type you selected.

To Remove a Task Constraint

Method 1

1. Double-click any cell in the desired task row to launch Task Information.
2. Click the **Advanced** tab
3. In the **Constraint type** drop-down list, choose **As Soon As Possible**
4. Click **OK**

The Constraint date will be automatically cleared.

As Soon As Possible is for schedules calculated from a Project Start Date.

Method 2

1. Highlight cell with either the Start or Finish date
2. Press the **Delete** key

This method is typically used when you accidentally enter in the Start or Finish fields

If you do not have a predecessor link to a task and remove a constraint, the task simply moves to the start of the project and you may lose information related to the desired date for the task. Be sure to create the appropriate links first.

Avoiding Accidental Constraints

The project manager creates constraints when entering a constraint type and date for a task. Constraints can be created in other ways as well, often accidentally.

The most common mistake made in Project is entering dates on auto-scheduled tasks directly in the Entry table portion of the view so that task constraints are created. Unnecessary constraints make it extremely difficult to manage project schedules, and track and update activities within your project.

Constraints on auto-scheduled tasks are set when you do any of the following:

- Enter or select from the date picker pop-up a Start Date directly in the Entry table.
- Enter or select from the date picker pop-up a Finish Date directly in the Entry table.
- Drag a Task Bar in the bar chart left or right.

By setting constraints, you effectively lock those tasks from moving in the future. As your project progress has an ebb and flow of activity that takes the timeline forward or backward, these tasks will remain unmoved and unmovable, and will tend to bring up error messages.

If a Start date is entered for an Automatically scheduled task, a **Start No Earlier Than** constraint will be applied to the task. If a finish date is entered a **Finish No Earlier Than** constraint will be applied.

When working with constraints you may be prompted with a Planning Wizard message. These messages are optional can be turned off individually or globally as desired.

How to Disable the Planning Wizard Messages

Method 1 – Disable an Individual Message

1. In the Planning Wizard dialog box that appears, click **Don't tell me about this again.**

Method 2 – Disable All Messages

1. Click the **File** tab
2. Click **Options**
3. Click **Advanced** in the Project Options dialog box
4. Uncheck **Advice from Planning Wizard**

You can use this process to enable groups of messages that you individually disabled.

Figure 7-1 PLACEHOLDER

If Planning Wizard messages are turned off, you will not be alerted to possible scheduling errors that might be created as a result of creating a constraint or other scheduling issues.

You may also notice smart tags appearing in cells as you work with constraints. You may click the drop-down arrow next to the caution indicator to review available options.

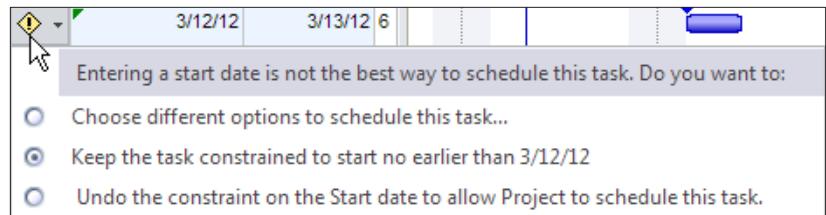

Figure 7-2 PLACEHOLDER

Selecting an option (even the suggested one by Microsoft Project) may alter your previously applied constraint.

If your scheduling style is to enter dates on each task, it is recommended that you use a manual scheduling approach instead of automatic scheduling. This will allow for tasks to be scheduled to the dates entered and will not be subject to the automatic scheduling engine of the software. If a task is scheduled using manual scheduling, the tasks can be changed to automatic scheduling at any time.

Constraints will also be entered as a result of the tracking process which will be discussed in a future module.

Effects of Constraints

Constraints may cause errors in the scheduling of a project that are not readily apparent. Refer to the example below.

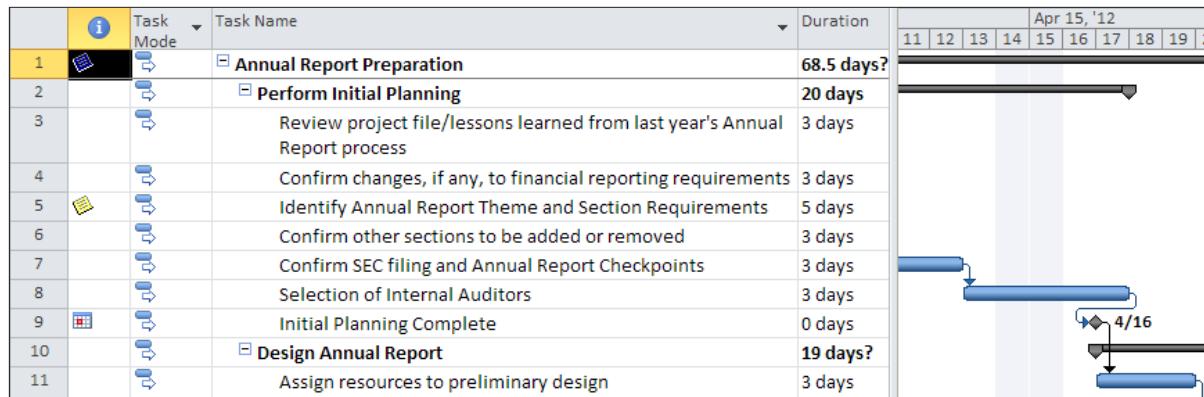

Figure 7-3 PLACEHOLDER

There is an error in the calculation of the date for the task 9 “Initial Planning Complete”. The relationship line after task 8, “Selection of Internal Auditors” flows backwards in time. The reason for this is that task 8 is scheduled to complete on April 17, one day later than the milestone target date of April 16. Tasks that are dependent on task 9 will also be miscalculated.

Monitoring for date calculation errors in your schedule is important.

Constraints should be used sparingly and the reason for a constraint should be document.

If you feel you must use constraints or enter start or finish dates for most of your tasks, manual scheduling might be your scheduling style.

Deadlines

Task Deadlines

Deadlines represent a finish date goal or objective for a task. Using a deadline on a task will still allow it to flow with changes to the schedule and will not restrict its start or finish date like a constraint will.

Use deadlines over constraints to eliminate pop-up error messages when planning or executing your schedule.

A project manager should use deadlines to mark targets in the schedule and to provide simple visual cues when a deadline is missed.

To Set a Task Deadline:

1. Double-click any cell in the desired task row to launch Task Information.
2. Click the **Advanced** tab
3. In the **Deadline field**, choose or enter the desired date
4. Click **OK**

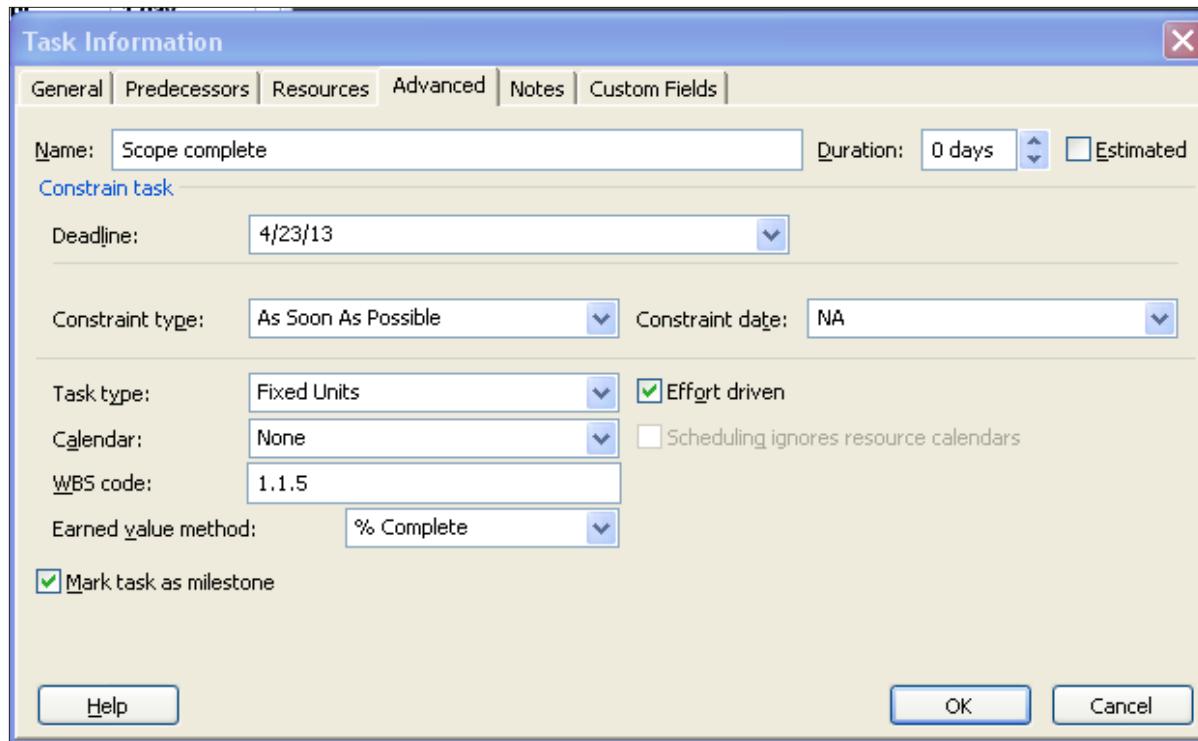

Figure 7-4 PLACEHOLDER

Refer to the following scenarios to further understand deadlines.

A deadline of April 23, 2013 has been assigned to the “Scope Complete” task below. The deadline is represented by the green arrow on the Gantt Chart and does not appear in the Indicator column.

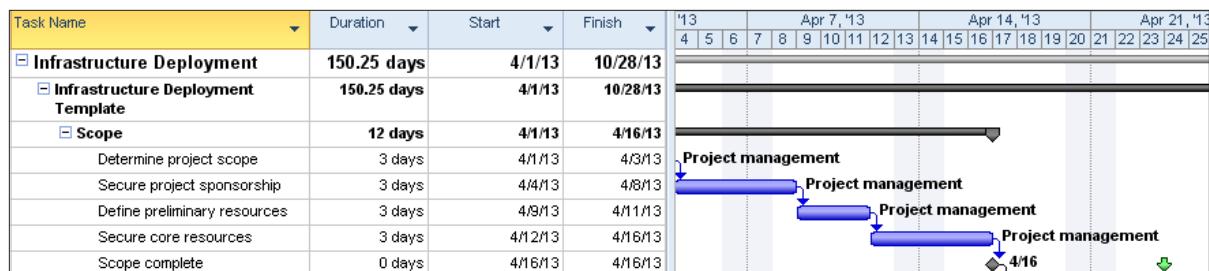

Figure 7-5 PLACEHOLDER

During project execution and tracking of the schedule, tasks will move forward in time. If a task with a deadline moves beyond the deadline arrow,

the task will be considered late. Below is an example of the warning that will appear in the Indicator column if a deadline is not met. Notice the red diamond in the indicator column explaining that the task date has exceeded the deadline date.

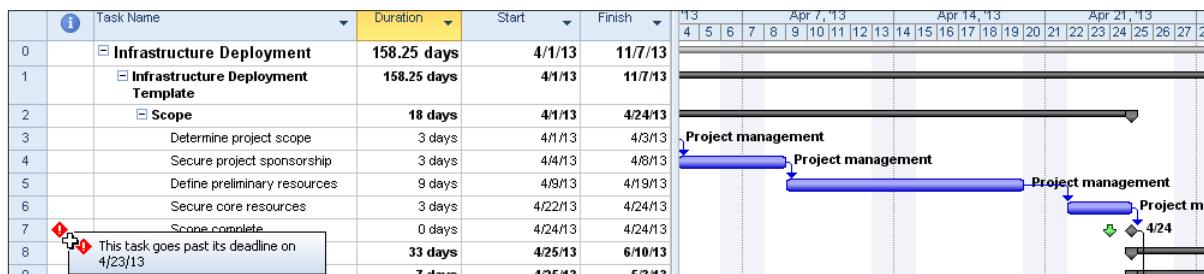

Figure 7-6 PLACEHOLDER

Another indicator to watch would be the Total Slack column. A negative value indicates that tasks are late and have missed or exceeded the deadline. The negative value indicates how many days the deadline was missed by. It is also an indicator of the amount of recovery time required to get the project back on track.

The Total Slack field provides information on auto scheduled tasks.

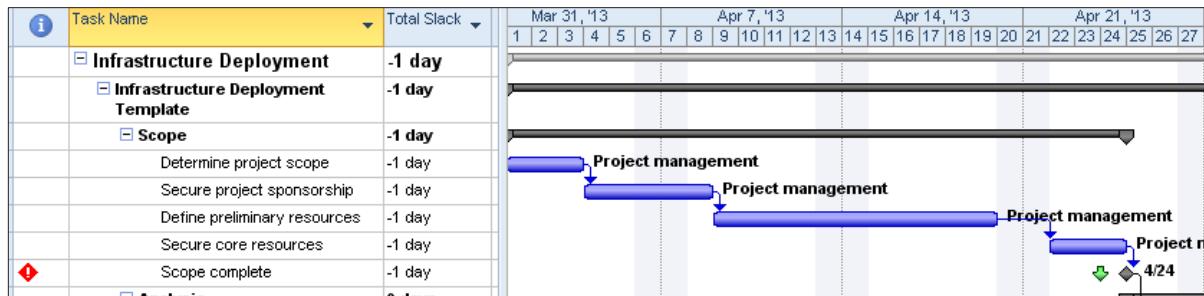

Figure 7-7 PLACEHOLDER

Unlike constraints, do not create date calculation errors in the schedule. Instead, they provide a visual indicator which flags you when deadline targets are missed.

Deadlines can be used in both manual or automatic scheduling mode.

To Remove a Task Deadline

1. Double-click any cell in the desired task row to launch Task Information.
2. Click the **Advanced** tab
3. In the **Deadline field**, select the date and press **Delete**
4. Click **ok**

Substitute deadlines for constraints when possible.

Place deadlines on milestones to help manage short term goals.
As long as the deadlines stay on the left side of the milestones,
you are doing well.

If a deadline date has been exceeded, check the Total Slack column or indicators column on auto scheduled tasks to see how much time needs to be made up to get back on schedule.

Split Tasks

Splitting Tasks

There will be times during project scheduling that will require an interruption of work for a particular task. For example when planning a task, some of the work will occur on Monday and the remainder will occur on Monday the following week. In this situation two tasks could be entered or creating a split task would also work. Split tasks are designed for scheduling tasks that start then stop and start again.

When to use split tasks:

- When the work of a long task is required to work around other tasks.
Some of the work would be done before a hard date and the remaining portion of the work would be scheduled after the hard date.
- Splits tasks may be used to help even out the resource work load
- 100% of the work for a task is not required to be performed without interruption and could be broken up over time.

To Split a Task

1. Click the Task tab
2. Click the Split Task icon
3. Position the mouse pointer in the middle of the Gantt bar for the desired task
4. Click and drag to the right until the desired split is achieved

Figure 7-8 PLACEHOLDER

Refer to the following tips and guidelines regarding task splitting.

Repeat the above steps to create additional splits.

Both auto and manually scheduled tasks can be split.

- Hover the split task mouse pointer over the Gantt bar of the task to be split.
The screen below will show the information box that will appear.
- As the mouse pointer is dragged the length of the Gantt bar, the date will change in the box. Clicking the mouse pointer will split the task and leave a gap between tasks.

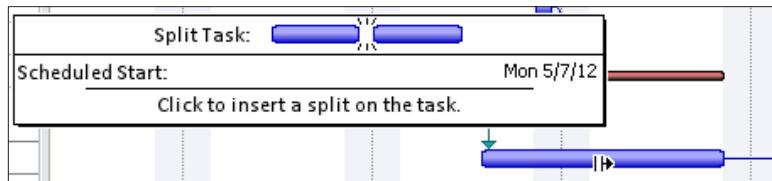

Figure 7-9 PLACEHOLDER

If the schedule has used “day” durations of tasks as the default scheduling increment, the gap in the split task will advance in 1 day increments or 1 week increments if “weeks” was used. A split task is shown in the view below.

Figure 7-10 PLACEHOLDER

The dots between the sections of the task are the split task indicators showing that the task has been split. The individual parts may be dragged back and forth as necessary to achieve timeframes that will work best for the task. Drag the pieces back together will eliminate the split status for the task.

To Unsplit a Task

1. Position the mouse pointer on the left side of a right most bar segment
2. Drag the segment to the left until it connects to the bar segment

Repeat the above steps to reconnect additional segments if needed.

There are a few rules, however that you should be aware of when working with split tasks:

- When a task is split, it is still one task and will be treated as such.
- Relationships will be applied to the beginning and ending of the entire split tasks only and not to the individual pieces. The individual parts are not separate tasks and cannot have discrete relationships.
- When resources are assigned, the work will be distributed over the total task duration and task as a whole.
- Constraints are applied to the start or the finish of the entire task and cannot be applied to the individual parts.
- The parts of the task may be dragged back together when needed.
- Tasks may be split multiple times.
- Splitting will refine the workload and the duration of the task.

Hiding bar splits will conceal separations of a task and may create confusion when the task duration does not match the Gantt bar length of the task.

Split bars will occur during the tracking process to represent a task which stopped and restarted or a period of inactivity.

Task Calendar

Applying Task Calendars

There will be times when a task must occur within a unique timeframe and outside of the project calendar parameters. In order to accommodate such instances, users can create a distinctive calendar that can be assigned to a task. In doing so the task will be scheduled in the unique timeframe and not affect the scheduling of the entire project.

Below are some examples of when a task calendar would be used:

- Testing at a bank can only occur after the bank is closed 9pm to 6 am
- A weekend cut over of a software package or upgrade
- Testing of a product that requires a 24/7 test
- A task that must occur on second shift
- Task applied to an resource in an alternate time zone

The first step in using task calendars is creating the calendar using the same process described in Chapter 4, *Start a Project* to create a base calendar. After the calendar is created, it then may be applied to task. There is an option to ignore the resource calendars and allow the scheduling of the resources to be directed by the task calendar for the specific task only.

To Assign a Calendar to a Task

1. Double-click any cell in the desired task row to launch Task Information.
2. Click the **Advanced** tab
3. In the **Calendar** drop-down list, choose the desired calendar
4. If desired, click **Scheduling ignores resource calendars**
5. Click **OK**

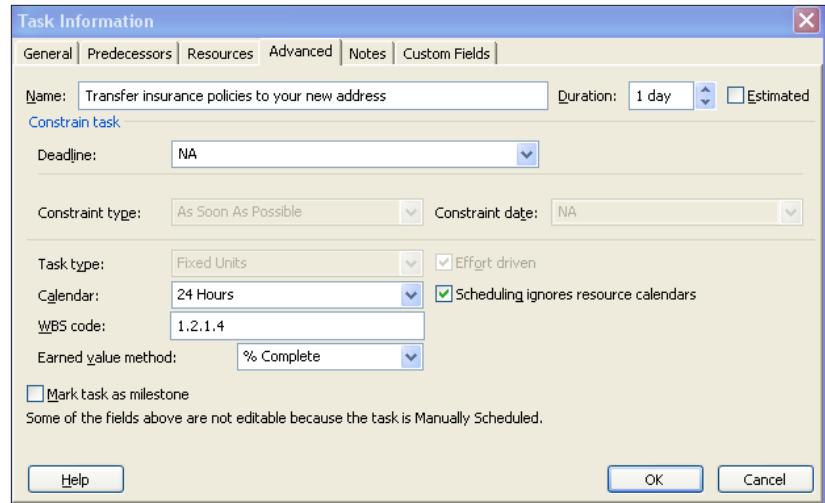

Figure 7-11 PLACEHOLDER

A visual indicator will appear in the Indicator column in the Gantt chart view.

Figure 7-12 PLACEHOLDER

Task calendars may only be applied to automatically scheduled tasks or manually scheduled tasks.

Move Project

Moving the Entire Project Timeline

Typically a project start date might change between the time the project is planned and the project actually starts. There are several methods available to change the project start date. It is important that the tasks are re-scheduled to adjust to the new start date.

The easiest way to change the project start date is use the Project Information box. Changing the start date using this method will move all tasks **without entered dates or constraints** to be rescheduled as of the new start date.

To Change the Project Start Date

1. Click the **Project** tab
2. Click **Project Information** in the Properties group
3. In the **Start date** field, enter or choose the desired new date
4. Click **OK**

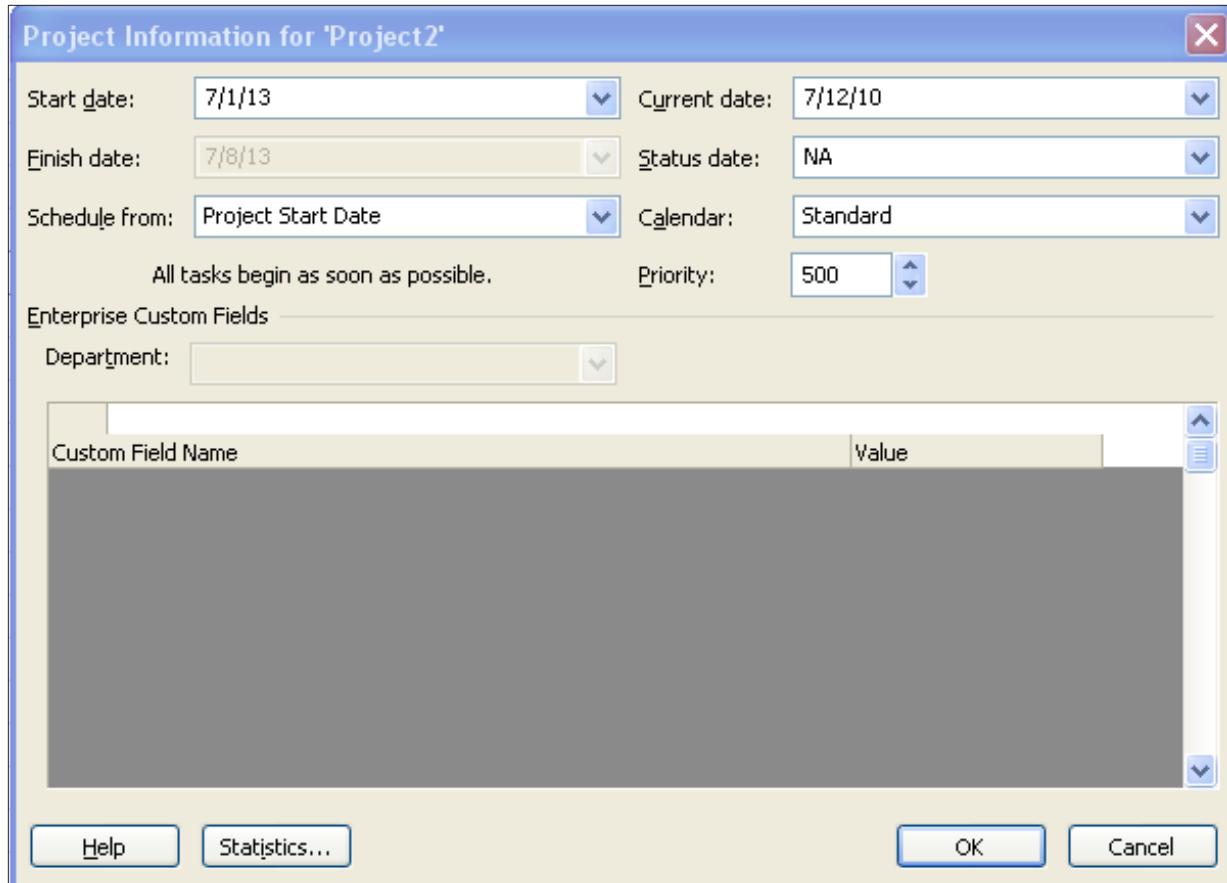

Figure 7-13 PLACEHOLDER

Changing the project start date will **not** reschedule tasks which have entered dates or constraints. Project 2013 provides a function called **Move Project** which will move all of the tasks to the new project start date. When tasks with constraints are moved using this function, the constraint dates will be adjusted based on the new project start date.

For example: if a task has a constraint 3 months from the start date of the project and the project start date is moved 6 months the constraint date will be re-scheduled 3 months from the new project start date.

The **Move Project** function also has an option to move project deadlines. If this option is not selected, the Deadlines will remain at the original dates and will need to be updated manually.

To change the project start date and move tasks with dates to a new timeframe:

To Move a Project

1. Click the **Project** tab
2. Click **Move Project** in the Schedule group
3. In the **New project start date** field, enter or choose the desired new date
4. Click **Move deadlines**
5. Click **ok**

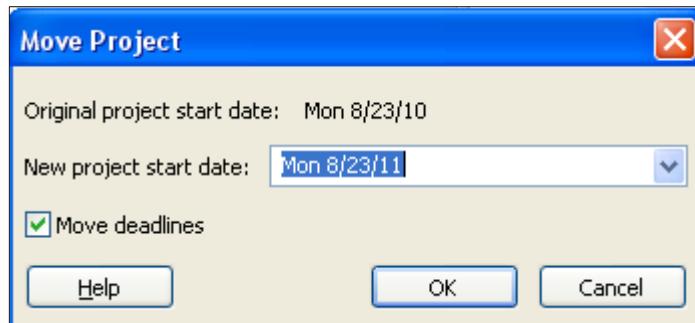

Figure 7-14 PLACEHOLDER

Any task that is not already linked in the schedule will move to the new start date that you enter using either of the methods above.

When you start a project as either a blank schedule or from a template, changing the project start date is recommended as a first step. If your project is fully planned out and has any type of task-related locked dates including deadlines or constraints, moving the project is recommended. This is especially useful when funding for a fully planned project has been delayed.

Task Notes

Adding Notes to Tasks

Each task has a freeform notes field. The notes field may contain several types of information such as objects, hyperlinks, bulleted lists, etc. Notes may be printed on reports, exported to Excel and may be used as needed throughout the life of the project schedule.

To Add a Task Note

1. Method 1
 - a. Double-click any cell in the desired task row to launch Task Information.
 - b. Click the **Notes** tab
 - c. Enter the note
 - d. Click **OK**
2. Method 2
 - a. Select any cell in the desired task row
 - b. Click the **Task** tab
 - c. Click **Task Notes** in the Properties group
 - d. Enter the note
 - e. Click **OK**

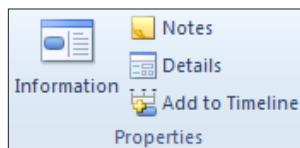

Figure 7-15 PLACEHOLDER

The notes view for a task is shown below:

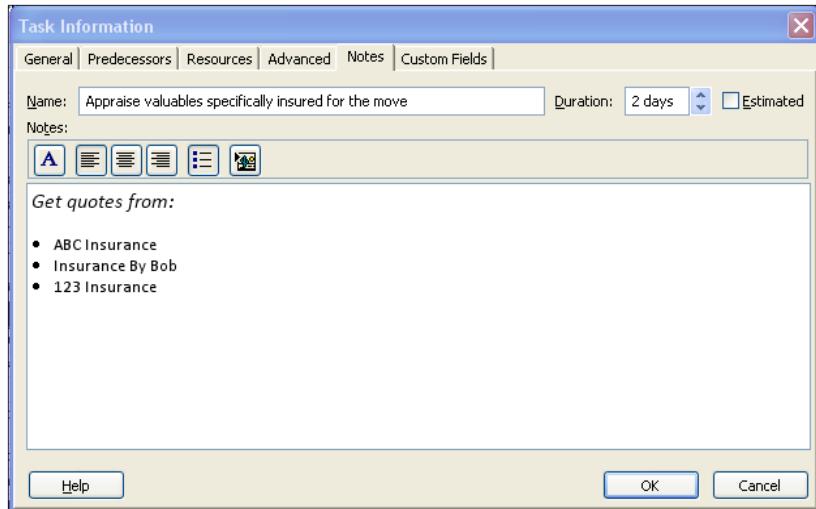

Figure 7-16 PLACEHOLDER

The Indicator column provides a visual indicator that a task note exists. Hovering the pointer over the icon will display the note preview to give the reader an idea of its content.

11		Verify that your belongings are move
12		Anraise valuables specifically
13		Notes: 'Get quotes from:
14		ABC Insurance
15		Insurance By Bob...' Policies to ' Insurance to '

Figure 7-17 PLACEHOLDER

Notes can be invaluable and should be used during the planning and execution of the project. After the project is completed and a post-project review is conducted, task note information will help in recalling details of what occurred during the performance of tasks.

Lengthy task notes might be better suited for storage in an external document that is hyperlinked to your schedule.

Chapter 8

Resources

Work, Material, Cost: Resource Types

Resources are an important part of a planned schedule. Project 2013 has the ability to offer multiple types of resources to help accomplish the work of a project. The different types of resources are intended to provide flexibility to address most types of resources required during the planning and management of a project.

In this chapter we will discuss the resource types and their intended use:

1. Work resources
2. Cost resources
3. Materials resources

Work Resources

Assigning work resources to a project will allow for resource requirement forecasting and project scheduling based on resource availability. Work resources are usually human resources but can also be facilities, equipment rental and other types of resources. Work resources are given an hourly rate. Resource costs can be forecasted using resource assignments to provide projected project budgets.

Effective uses of Work Resources are:

- Individual people – actual named resources
- Generic resources – these are job titles that can be used as place-holders to identify resources by skill type, skill level or if a resource is unknown. For example: DBA, Developer Level 1, Event Planner, Plumber
- Consolidated resources – used to state the quantity of a specific type of resource. For example: Helpdesk, Movers, Painters, Attendees, Members
- Facilities – a room or area that must be reserved for a period of time
- Contracted resources – external contracted labor

- Equipment – a machine that is priced by the hour

Cost Resources

Cost Resources are defined as a type of cost that occurs one or more times during the project but has a variable amount. Use of Cost resources enables the scheduler to add estimated costs during the planning phase of the project and the ability to categorize these costs. These costs will be updated into the baseline. When actual costs become available during tracking, the actual costs will be updated and compared against the original estimates to provide a variance.

Cost resources will inherently increase the cost for a task and for the project. Cost resources have no effect on work or duration. The cost amount is applied to tasks as a flat amount at the time of assigning the cost resource to a task.

Effective uses of Cost resources are:

- Travel expenses estimated in advance
- Meal expenses estimated in advance
- Expenses for something used on the project that has a varying value each time it is used, such as a permit or license renewal

Project allows for as many cost resources as needed but for simplicity try to consolidate cost resources and keep them to a limited number. The type of reporting required for the project would drive the quantity of cost resources that will be needed.

If your project includes fixed price contracts and you would like to include those on the project, you may want to consider assigning the vendor as a cost resource to a task and entering the value of the contract. If you do not need to incorporate the vendor name, you should probably use the Fixed Cost field to record the value.

Material Resources

Material resources are defined as consumables. For example: Reference books for a new product might cost \$50 each and 20 books are needed. A material resource would be created with a cost of \$50 per book. An assignment would be entered for a task for 20 books. As a result \$1,000 is added to the cost of the project. During tracking, the actual cost of the books purchased would be provided.

The cost of the material resources are added to the total cost of the project and updated into the project baseline. Material resources do not affect work or duration.

Effective uses of Material resources are:

- Construction: create a material resource for the cost of 1 foot of trim.
Enter the number of feet required for the task
- Conference: create a material resource for the cost of giveaway bags.
Enter the number of giveaway bags needed for the conference

If your project will be using a large quantity of materials such as a construction project, using Excel might be less work and a more effective means of keeping track of materials.

All resource and fixed costs are summed into the Cost field which becomes the planned budget for the project and is captured in the baseline cost.

Resource Sheet

The Resource Sheet is where all resource records are stored. Work and material resources store their costs on the resource sheet; while cost resources have a unique cost added each time they are assigned to a task.

The quantity of a resource is determined when the resource is assigned to the task. For example, the number of hours a work resource will be needed comes from the task estimate. The number of units of a material resource is modified when the resource is assigned to the task. Normally a cost resource is always assigned at one unit on a task.

To display the Resource Sheet:

1. Click the **Task** tab
2. Click the drop-down arrow on **Gantt Chart** in the **View** group
3. Click **Resource Sheet**

The default table of the Resource Sheet is called the entry table which is shown below. This table is a subset of many of the resource fields of information that are available. This table represents the most common fields that are needed for a resource. More information is accessible through the Resource Information dialog box which will be discussed later in this chapter.

		Resource Name	Type	Material	Initials	Group	Max.	Std. Rate	Ovt. Rate	Cost/Use	Accrue	Base

Figure 8-1 PLACEHOLDER

To enter a resource, type the resource name in the “Resource Name” field. The Resource Name is the key field for the resource data.

Project does not allow commas in the resource name field.

Many reports and assignment views will display resources in alphabetical order. A standard of last name first name allows for easy location of resources while making assignments.

After the resource name is entered, several fields will be populated with default information.

Change the resource type before entering any information to enable/disable the appropriate fields on the resource sheet.

		Resource Name	Type	Material	Initials	Group	Max.	Std. Rate	Ovt. Rate	Cost/Use	Accrue At	Base Calendar	Code
1		Smith Robert	Work		S		100%	\$0.00/hr	\$0.00/hr	\$0.00 Prorated	Standard		

Figure 8-2 PLACEHOLDER

Descriptions of the fields on the resource sheet are provided below:

Type: Work is the default and will establish the value entered in the resource name field as a work resource. Other values are material and cost and can be changed by clicking the drop down arrow and changing the type selection.

Material: Used for Material resources only – skip for work and cost resources.

Initials: If desired, enter initials for resources. Initials may be substituted on Gantt Charts or reports as needed to shorten reports.

Group: Group is an optional field which supports the entry of numbers and text. It is usually used for department, location or skill set. This information is used to generate reports by groupings of resources.

Organizations should set a standard for the use of this field to help schedulers work with different projects more effectively.

Max units: The Max units' value is an indicator of the quantity of a resource that is available. For work resources you should enter the value for the resource on the project. The default value is 100%. When entering a group resource such as the number of people on the Helpdesk, enter the number of resources in the group. Each resource represents 1 unit.

For example if there are 5 people on the Helpdesk, enter 500% in the Max Units column. For material resources, this field is unavailable since the assumption is you can purchase more materials. For cost resources, this field is also unavailable since you manually provide a cost, no calculation is needed with units. The value shown above is in the default percentage format but can also be viewed as a decimal value.

The default value for max units is a percentage format, but can also be displayed in a decimal format as desired.

Standard rate: Enter the desired rate for the resource that you want to have used in calculations.

Overtime rate: Enter an overtime rate for the resource. Keep in mind, it will affect only overtime hours entered.

If your overtime rate is a value calculated against the standard rate (e.g. time and 1/2), you need to figure out the calculation and enter the grand total in the overtime rate. Project with use the overtime rate value in place of the standard rate value not in addition to.

Cost per use: An extra value that may be added to a task over and above the Standard Rate for the resource. For example: A repairman is called to fix a refrigerator. The repairman charges a transportation charge, and hourly rate, plus parts. The cost per use is the transportation charge and would be applied to every task the repairman would be assigned to.

Accrue at: Cost accrual is an indicator of a point in time when costs are incurred. Cost accrual settings have 3 options: incur costs at the start of the task, incur costs at the end of the task, or incur costs throughout the task (prorated). Prorated accrual is the default option.

Base calendar: Each work resource will have a resource calendar associated with it. The resource calendar is based on calendars that have been previously established for the project. The Standard Calendar is the default resource Base Calendar. If the base calendar contains company non-working time it is not necessary to reestablish company holidays, statutory holidays, etc. as all of these will be applied to the resources. Use the dropdown list to select the appropriate calendar for a resource.

Code: This field is available for additional information about a resource

that you might want to track such as a cost center or department code.

The Resource Information dialog box is used to record information about a resource that is not captured in the Resource Sheet.

To view Resource Information dialog box:

1. Click the **Resource** tab
2. Click **Information** in the View group

An alternate method is to right-click the resource name and click Information. You can also double-click some empty white space next to a resource name to open the same dialog box.

Resource Information

General | Costs | Notes | Custom Fields |

Resource name:	Smith Robert	Initials:	S																												
Email:		Group:																													
Windows Account...		Code:																													
Booking type:	Committed	Type:	Work																												
		Material label:																													
Default Assignment Owner:		<input type="checkbox"/> Generic <input type="checkbox"/> Budget <input type="checkbox"/> Inactive																													
Resource Availability																															
<table border="1"><thead><tr><th>NA</th><th>Available From</th><th>Available To</th><th>Units</th></tr></thead><tbody><tr><td>NA</td><td>NA</td><td></td><td>100%</td></tr><tr><td> </td><td> </td><td> </td><td> </td></tr><tr><td> </td><td> </td><td> </td><td> </td></tr><tr><td> </td><td> </td><td> </td><td> </td></tr><tr><td> </td><td> </td><td> </td><td> </td></tr><tr><td> </td><td> </td><td> </td><td> </td></tr></tbody></table>				NA	Available From	Available To	Units	NA	NA		100%																				
NA	Available From	Available To	Units																												
NA	NA		100%																												
<input type="button" value="Help"/>		<input type="button" value="Details..."/>	<input type="button" value="OK"/>	<input type="button" value="Cancel"/>																											

Figure 8-3 PLACEHOLDER

General tab data:
Email: optional
Logon Account: optional
Booking Type, Default Assignment Owner, Inactive: Project Server only

Generic: Optional. Select this option to indicate that the resource is a generic resource. A generic resource is a skill or role type resource to be used as a holding value until a human resource is assigned. When generic resources are used, the default base calendar is used for scheduling.

Budget: An attribute applied to a resource to limit it to project-level budgeted.

This feature will be discussed in the advanced materials.

Resource availability: Enter dates if the resource is only available for a particular period of time or has limited availability for a particular period of time. For example: An outside contractor is hired for a specific length of time. Enter the date ranges the resource will be available.

Calendar

Change Working Time button:

Use this option to create a specific calendar exception for a resource. This could incorporate vacation time or alternate working hours.

This dialog box is identical to the one used to change project and base calendars discussed in an earlier chapter. The calendar displayed automatically includes the settings based on the calendar you selected for the resource base calendar. This saves time since corporate exceptions are already included. Changes to this calendar are made in the same way that changes were made to the project calendar.

Click **OK** to save changes and return to the Resource Information dialog box.

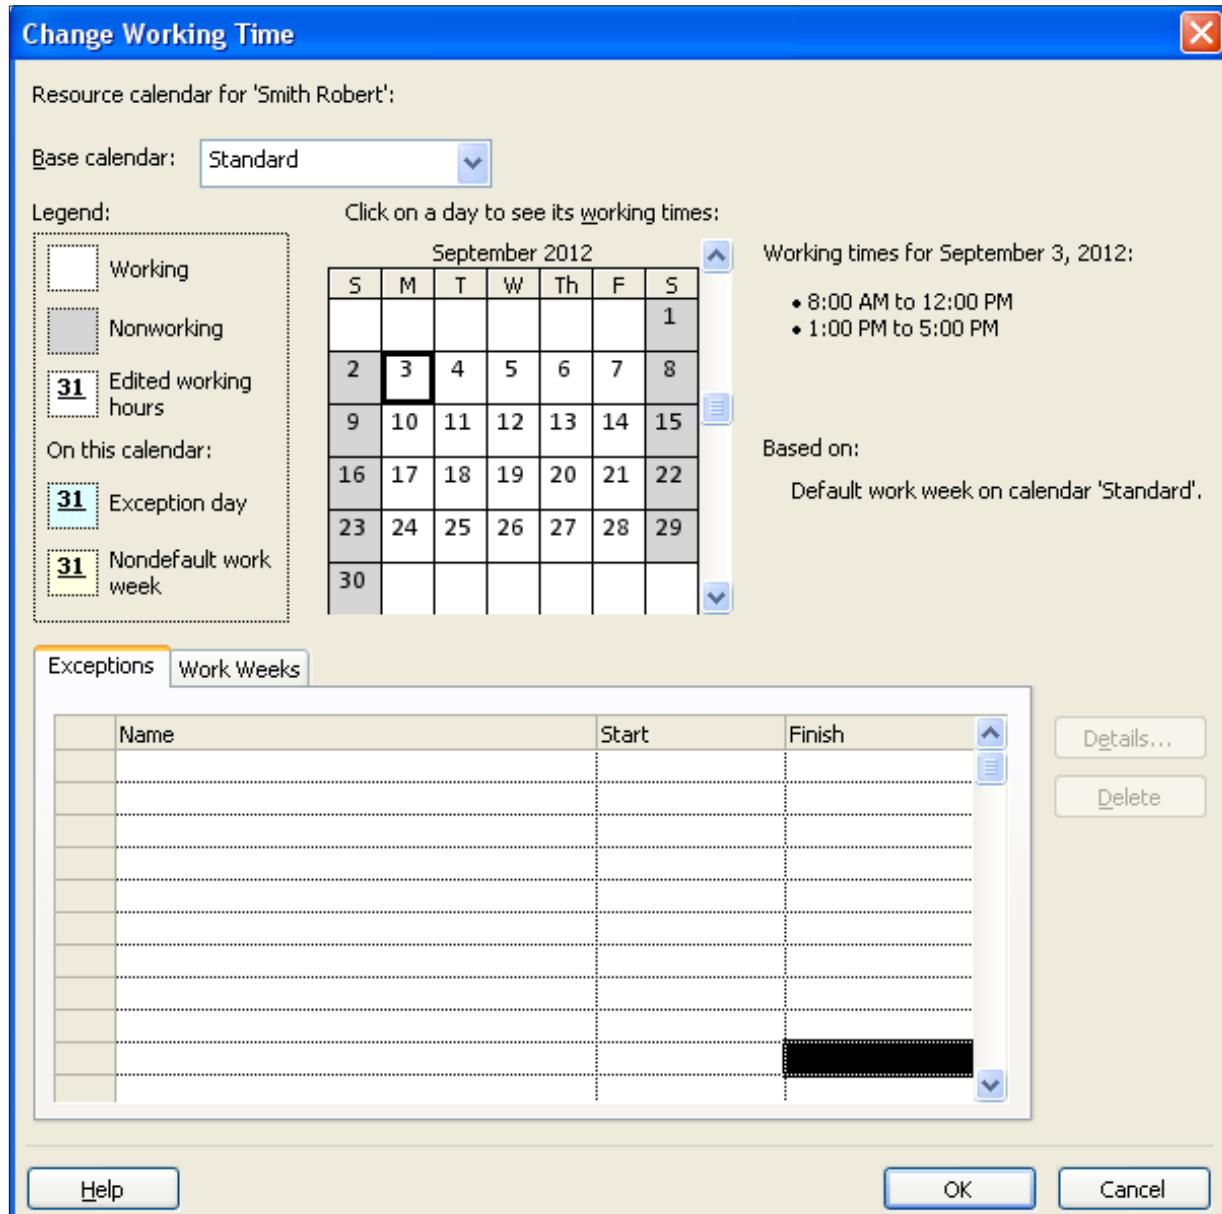

Figure 8-4 PLACEHOLDER

Cost tab data:

This tab is reserved for recording increases to costs of resources.

Most organizations using costing experience periodic rate changes. The effective date allows early storage of future rate adjustments that become active based on a cut off date. If a project spans the cut off date, the tasks before the cut off date of the project will be costed at the earlier date rate and the remaining tasks which exceed the cut off date will contain increased rate. It is easy to see that if a project runs late, the cost of the project will increase when resource rates increase.

Figure 8-5 PLACEHOLDER

Notes tab data:

Resource notes are treated the same as task notes within Project 2013. Resource note data has the same formatting and flexibility as task notes.

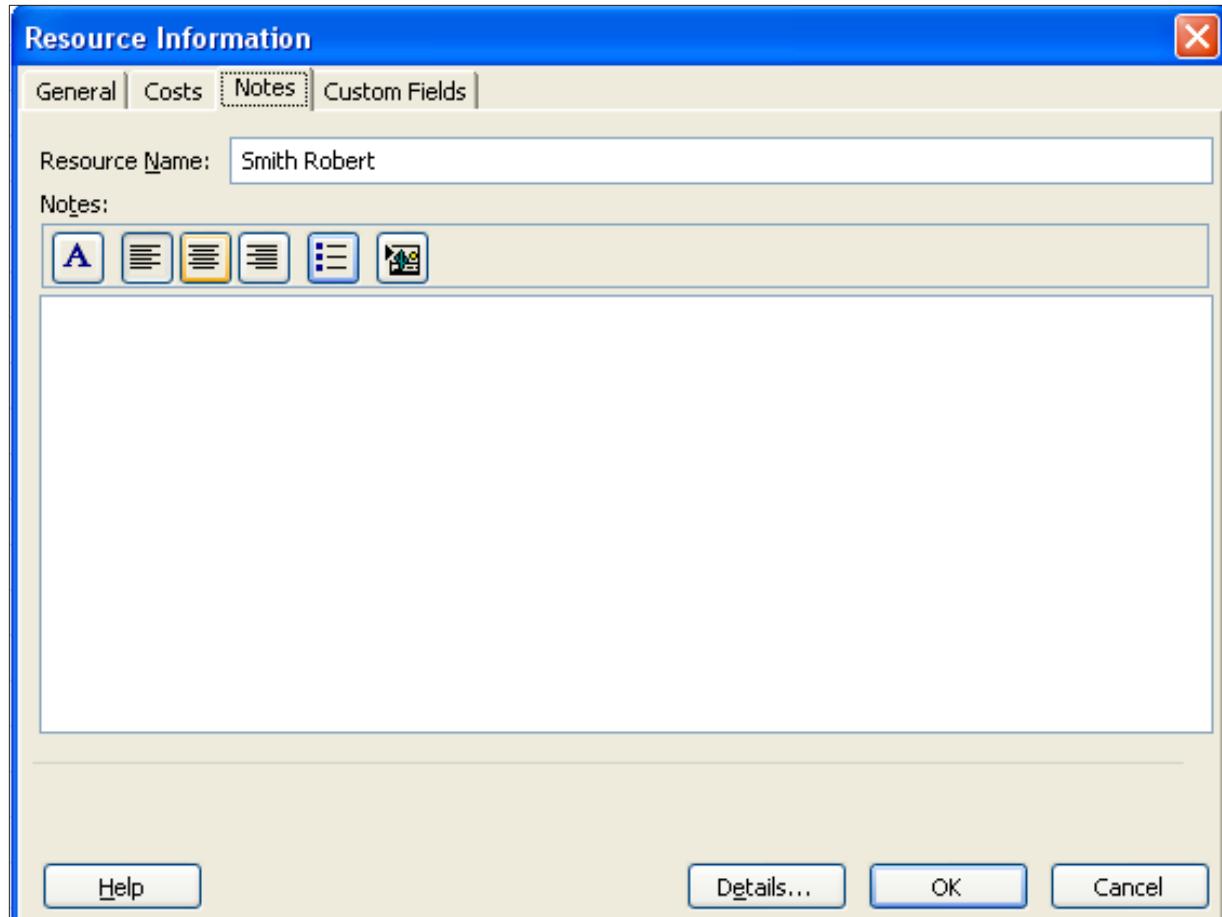

Figure 8-6 PLACEHOLDER

Custom Fields tab data:

This tab is reserved for Project Server or other applications that integrate with Project.

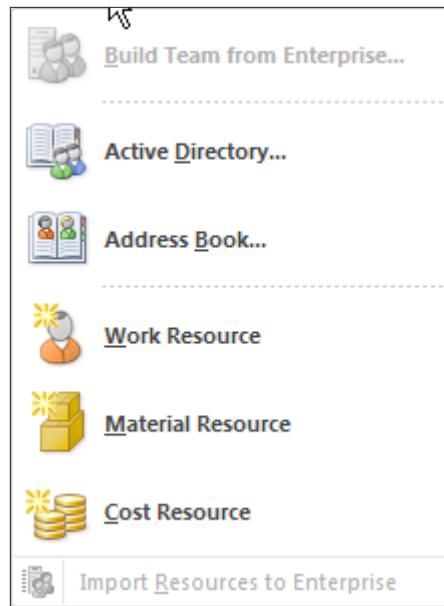

Figure 8-7 PLACEHOLDER

Material Resources

Material resources are supplies to be used by the project, such as paint, building materials, equipment, etc. Material resources are valued based on the quantity of material to be used which is assigned to a task.

Below are the fields associated with Material resources.

Resource name: name of the consumable item

Type: Material

Material label: boxes, gallons, feet, each – the label that describes the material

Standard rate: the per unit/each price

Resource Name	Type	Material	Initials	Group	Max.	Std. Rate	Ovt. Rate	Cost/Use	Accrue At
Smith Robert	Work		RS		100%	\$100.00/hr	\$0.00/hr	\$0.00	Prorated
Paint	Material	gallons	P			\$25.00		\$0.00	End
PC's	Material	desktops	PC			\$2,000.00		\$0.00	Prorated
Boxes	Material	each	B			\$10.00		\$0.00	Prorated

Figure 8-8 PLACEHOLDER

Cost Resource: Lite

Cost resources are used to apply estimated costs specific tasks in a project. Estimated costs are entered during the planning stage and tracked when actual costs are entered during the execution or control stage of the project.

To enter a cost resource:

Resource name: For example: Cost travel, Cost food, Cost room rental, etc.

Type: Cost

No other information is required. The amount of the cost will be added at the time the assignment is created.

When naming cost resources include “Cost” as the first word in the name. It will be helpful when assigning cost resources for the name to give an indication of the resource type. Resources appear in alphabetical order when creating assignments and including “Cost” as the first word ensures all Cost resources will be grouped together in the list.

	i	Resource Name	Type	Material	Initials	Group	Max.	Std. Rate	Ovt. Rate	Cost/Use	Accrue At	Base Calendar
1		Smith Robert	Work		RS		100%	\$100.00/hr	\$0.00/hr	\$0.00	Prorated	Standard
2		Paint	Material	gallons	P			\$25.00		\$0.00	End	
3		PC's	Material	desktops	PC			\$2,000.00		\$0.00	Prorated	
4		Boxes	Material	each	B			\$10.00		\$0.00	Prorated	
5		Cost travel	Cost		C						Prorated	
6		Cost food	Cost		C						Prorated	
7		Cost room rental	Cost		C						Prorated	

Figure 8-9 PLACEHOLDER

Note to Cindy – find assignment information.

Chapter 9

Work Assignments

What is an Assignment?

The “what” of the project are the tasks which represent what work needs to be accomplished. The resources are the “who” or who will perform the work. The assignment is applying the resource to the task to create the “when” and for “how much ” (cost and time). How the assignment is created will result in different outcomes for the values in the assignment. The values used in creating the assignment will drive the result for the duration, work and quantity of the resource assigned to the task. In this chapter, we will discuss techniques you can apply to generate the desired calculation result.

Review of Task Types and Effort-Driven Scheduling

Understanding task types and effort-driven settings are essential to understanding how Project performs calculations. Earlier we discussed what these terms mean and it would be helpful to review them before we create work assignments.

Effort-driven: A task set to effort driven means resources are able to work together on a task and therefore hours should be divided across the resources. Effort-driven can be turned on or off with Fixed Duration and Fixed Units tasks.

Project 2013 allows for 3 task types for scheduling:

- **Fixed Duration:** A fixed duration task is a task created with a fixed length of time.
- **Fixed Units:** Fixed Units is the quantity of resource assigned to a task and is the default task type. The quantity can be expressed in hours or a percentage of a whole resource.
- **Fixed Work:** The work of the task is fixed. Fixed work tasks are always effort-driven by default. The more resources assigned to the task,

the less time the task will take to be completed because the work is divided over the resources.

When coupled with the effort-driven option, the scheduling engine allows for 5 combinations of task type, effort-driven settings:

- Fixed Duration, Effort-driven on
- Fixed Duration, Effort-driven off
- Fixed Units, Effort-driven on
- Fixed Units, Effort-driven off
- Fixed Work, Effort-driven on

To create effective resource scheduling assignments it is imperative that the task types and effect-driven settings for the tasks are correct. Different settings deliver different results during assignment creation.

Summary tasks are always Fixed Duration and can not be changed.

- Manually scheduled tasks vs. Automatic scheduled tasks:
- The scheduling engine ignores task type and effort-driven flags for manually scheduled tasks. These values apply only to automatically scheduled tasks.

If a task is changed from manual scheduling to automatic scheduling, the task type and effort-driven values become meaningful. The value for these fields will be picked up from the options default settings when the task is entered. These values should be rechecked when switching modes to ensure correctness.

Task Type Scenarios

As discussed in *Define Duration, Work, Task Types and Effort Driven* on page 73, Project is set up for planning tasks by duration. This is the reason why there are question mark icons in each duration cell: they are a reminder that you did not enter a value for that task. The question mark symbol goes away after a number is entered. Typically, new and beginning users follow this approach. If a schedule is created that will not use resources, this is also the recommended approach.

This chapter introduces you to creating resources and assigning them to tasks. With the introduction of resources, your task estimating approach becomes important because as soon as a resource is assigned the scheduling engine performs a calculation.

The following scenarios will help you ensure that your preferred approach is applied when resources are assigned.

Scenario 1: Entering a Constant Duration Value

Let's say you would like to enter a duration value that remains constant regardless of the resources that are added or subtracted.

The recommended practice is to estimate the task by entering a duration value, set the task type to Fixed Duration and then assign the resources.

This will cause total work for the task to be calculated.

		Task Name	Duration	Type	Effort Driven
1		Prepare Facilities	1 day?	Fixed Duration	No
2		Begin Registration	5 days	Fixed Duration	No
3					

Figure 9-1 Entry Table with Duration and Optional Fields

The Effort Driven option provides a shortcut to divide the total work for the task across the resources assigned. This is useful for organizations that track costs or track resource assignments in detail.

To follow this approach, insert the Type and Effort Driven columns in the Entry table of Gantt Chart view or display Task Entry view which provides these fields in the lower pane. For more information about modifying views, refer to *Overview of Common Views* on page 18 and *Popular View Adjustments and Navigation* on page 24.

Scenario 2: Entering a Constant Work Value

You also have the choice to enter a total work value for the task that remains constant regardless of the resources that are added or subtracted. This is also called effort-driven estimating.

The recommended practice is to estimate the task by entering a Work value, set the task type to Fixed Work, and then assign the resources.

This will cause total duration for the task to be calculated.

		Task Name	Duration	Work
1		Prepare Facilities	1 day?	40 hrs
2				

Figure 9-2 Entry Table with Work Field

To follow this approach, insert the Work column in the Entry table of Gantt Chart view. This is where you will enter your total Work estimate.

Do not enter anything in the Duration field. The Type field is also needed and may be inserted as a column or displayed in Task Entry view.

For more information about modifying views, refer to *Overview of Common Views* on page 18 and *Popular View Adjustments and Navigation* on page 24.

For a more detailed discussion of Task Types, refer to Chapter 3, *Advanced Work with Task Types* in our <ADVANCED BOOK TITLE>.

Techniques to Assign Resources

Project provides multiple techniques to assign resources to tasks. Some methods are very quick, while other methods are more involved. Each method has advantages and disadvantages. You should decide which approach you prefer when making an assignment.

Task Entry view or a custom Entry table with added columns are preferred when you want to see Duration, Work, Task Type, and Effort Driven fields displayed at the same time.

Assignments Using the Resource Names Column

This technique is the quickest way to make an assignment; however, additional options such as units and work for the resource are not editable.

1. Click the **Task** tab
2. Click **Gantt Chart** in the View group
3. For the desired task, click the drop-down arrow in the Resource Names column and click to assign each desired resource

Assignments Using Task Information

This technique is also a fast way to make an assignment. It is especially useful when working with cost resources so you can enter the value following the assignment.

1. Click the **Task** tab
2. Click **Gantt Chart** in the View group
3. Double-click the desired task
4. Click the Resources tab
5. On a blank row, click the drop-down arrow in the **Resource Name** column and click to assign one resource
6. Modify the values in **Units** or **Cost** if desired
7. Repeat if needed
8. Click **OK**

Assignments Using the Assign Resources Dialog Box

This technique is a good way to make an assignment when you want to assign one resource to multiple tasks or multiple resources to multiple tasks. The dialog box remains open after you complete an assignment to allow you to immediately make an additional assignment. Either a Work or Units value can be manually entered in the Units field if desired when assigning a resource.

1. Click the **Task** tab
2. Click **Gantt Chart** in the View group
3. Click the **Resource** tab
4. Click **Assign Resources** in the Assignments group
5. Highlight the desired tasks, highlight the desired resources and click **Assign**
6. Modify the **Units** value if desired
7. Repeat if needed
8. Click **Close** when done

Use the Shift key to select adjacent tasks or resources. Use the Ctrl key to select non-adjacent tasks or resources.

Assignments Using Task Entry View

This technique is a good way to make an assignment when you want to focus on one task but create one or several resource assignments. It is a useful view because both the Work and Units fields are displayed and editable if desired. This option allows you to make multiple changes before you trigger the recalculation by Project. Notice the **ok** button is shown which indicates Project is waiting for you to finish your edits.

1. Click the **Task** tab
2. Click the drop-down arrow on **Gantt Chart** in the View group
3. Click **More Views**
4. Click **Task Entry** in the Views list
5. Click **Apply**
6. Click the desired task in the upper pane
7. On a blank row, click the drop-down arrow in the **Resource Name** column and click to assign one resource
8. Modify the values in **Units** or **Work** if desired
9. Repeat if needed
10. Click **ok**

Clicking another task or pressing the **Enter** key twice on the keyboard is the same as clicking the **ok** button.

Fixed Work Assignments

Fixed work tasks are tasks where the value entered in the work column is a fixed value for the task. Duration is always calculated based on the number of resource units assigned to the task and the status of resource availability.

The following examples continue to use the Task entry view with the subview Work. In the example below, the automatic scheduled task “Pack the boxes” is estimated at 200 hours of work. It is also a fixed work task which is always effort-driven. Notice that the task duration is 1 day. Since the duration is always calculated for a fixed work task, the value in the duration field is not important.

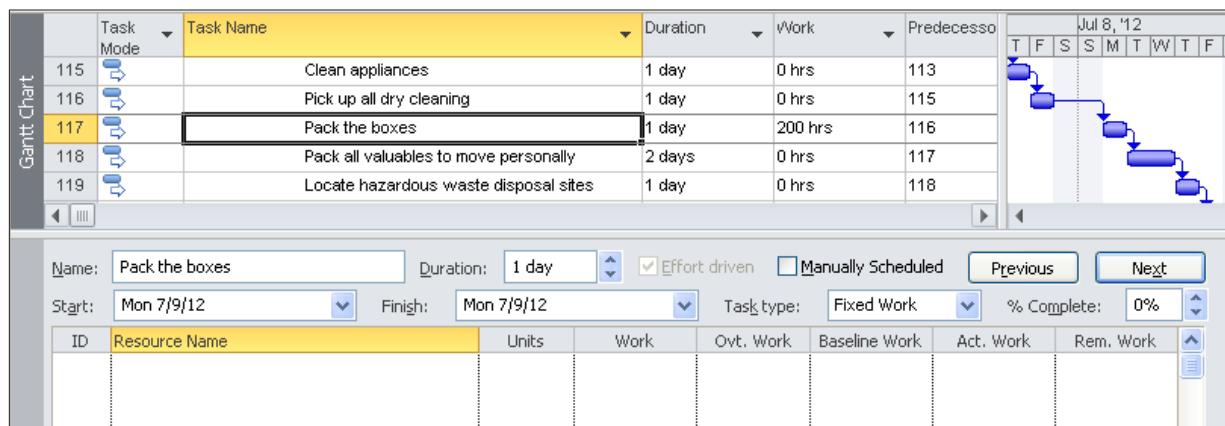

Figure 9-3 PLACEHOLDER

In the example below, 1 resource has been assigned to “Pack the boxes”. As a result, Eric will be assigned to work for 25 days at 8 hours a day packing boxes.

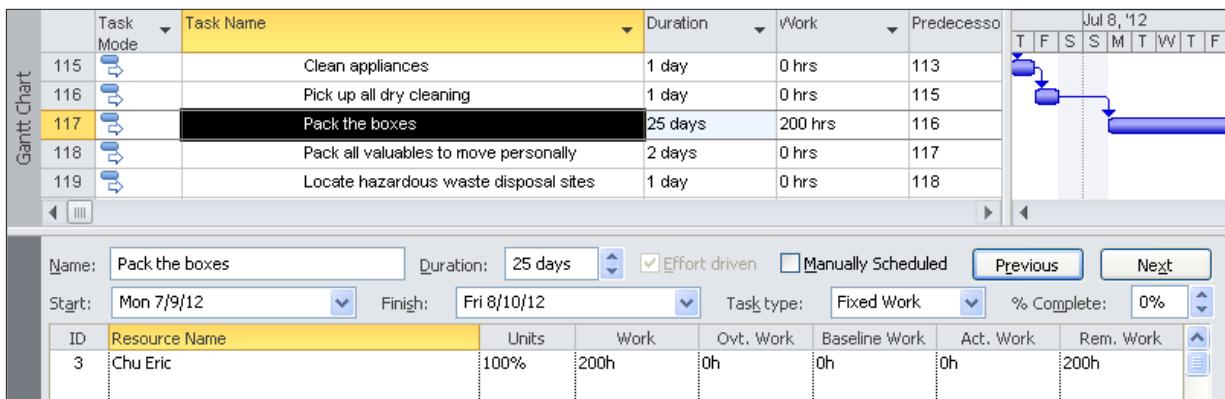

Figure 9-4 PLACEHOLDER

In the example below Eric has been given 2 people to help him with this task. The task will now take 8.33 business days to accomplish the work with each resource working 66.67 hours on this task. The work for the task has not changed. It does not make a difference whether all resources are assigned at one time or individually.

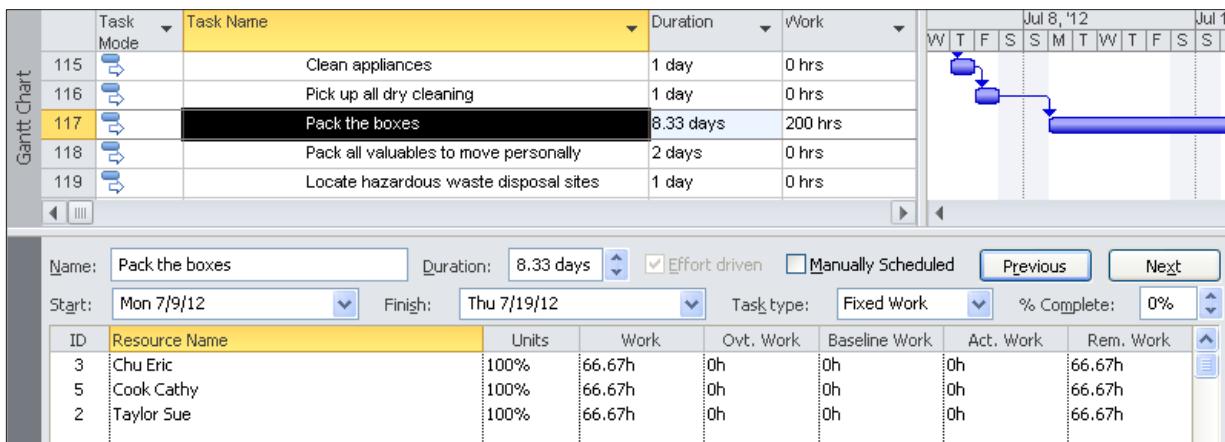

Figure 9-5 PLACEHOLDER

Fixed Duration Assignments

Fixed duration task assignments have a fixed length of time. The amount of work that is accomplished between the task dates will be dependent upon the number of resources assigned to a task, number of resource units and the availability of the resources.

The following examples will continue to use the Task Entry view with the Work subview in the lower pane. In the example below, the automatic scheduled task “Verify that your belongings are insured for the move” will take 5 days to accomplish. This example is fixed duration, effort-driven off. The assigned dates are May 1 to May 7. The dates span more than 5 days because it crosses over non-working weekend days. There are also zero hours of work entered for the task.

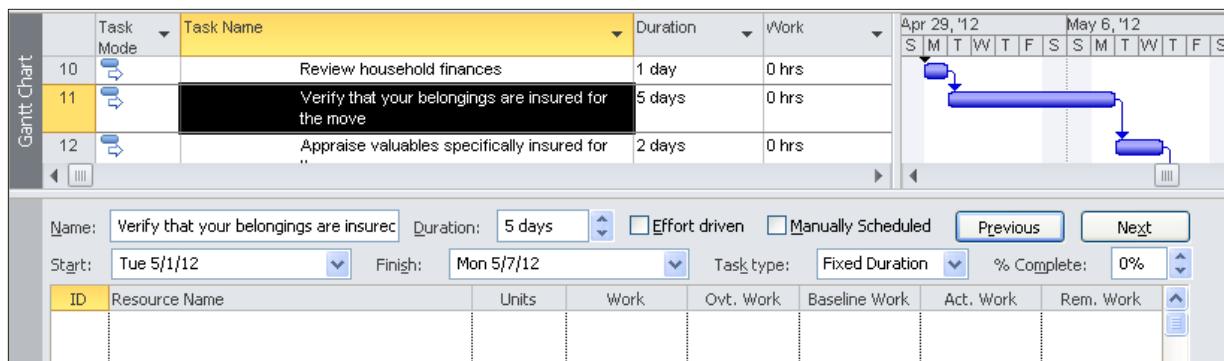

Figure 9-6 PLACEHOLDER

When one resource is assigned to the task the duration will remain the same and the work is increased to 40 hours. Note the work and duration in the view below.

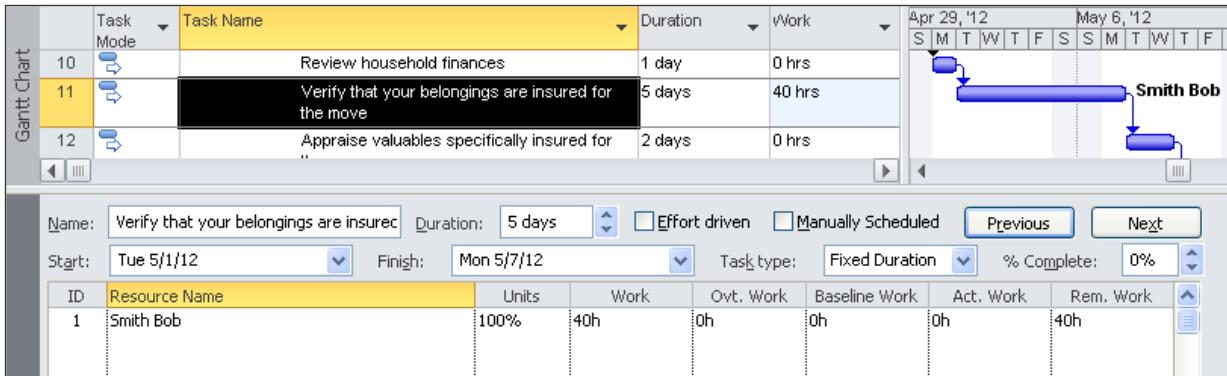

Figure 9-7 PLACEHOLDER

When an additional resources are added, the duration remains the same and the work increases again. The three assignments result in 120 hours of work for the task. The dates have not changed.

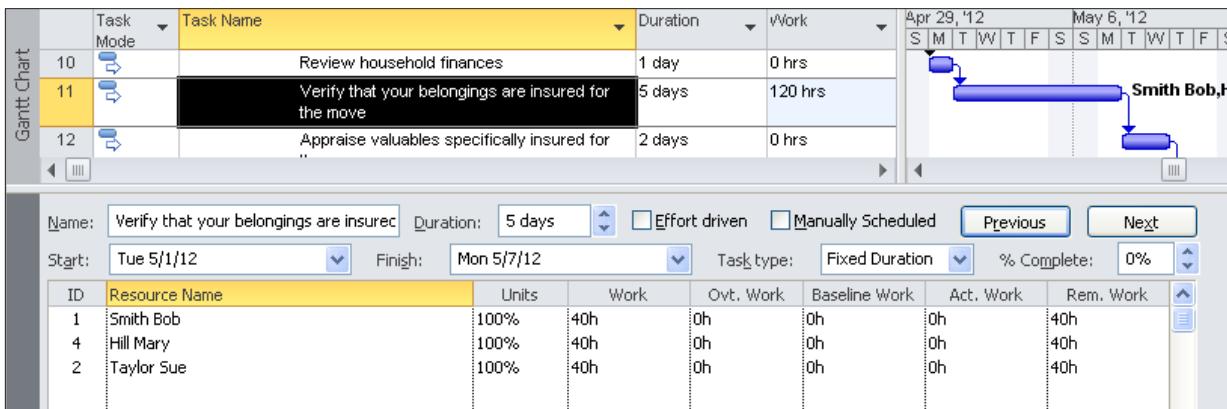

Figure 9-8 PLACEHOLDER

In the following example, all 3 resources have removed and the task type effort-driven flag has been turned on. One resource was then assigned to the task.

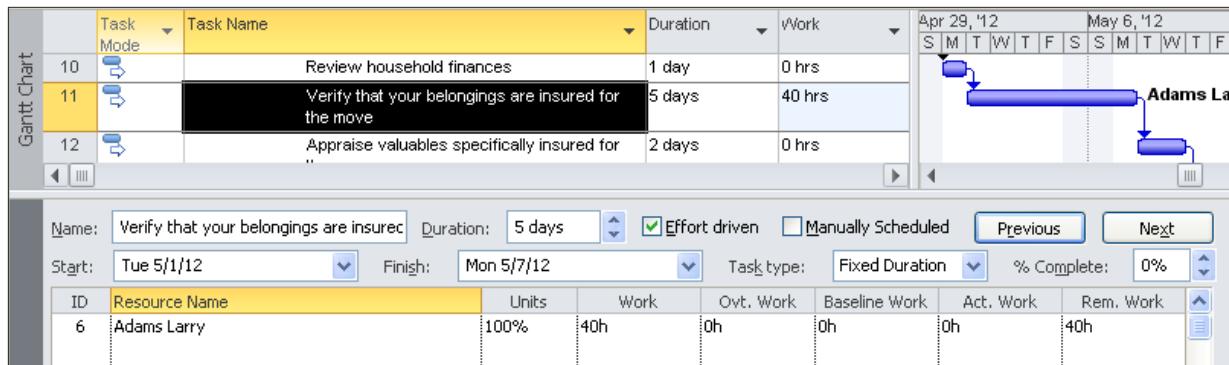

Figure 9-9 PLACEHOLDER

In the example below 2 more resources were added to the task. The task remains at 5 days duration and the work also remained at 40 hours. The work was divided between the resources. In this example, the resources were assigned one at a time.

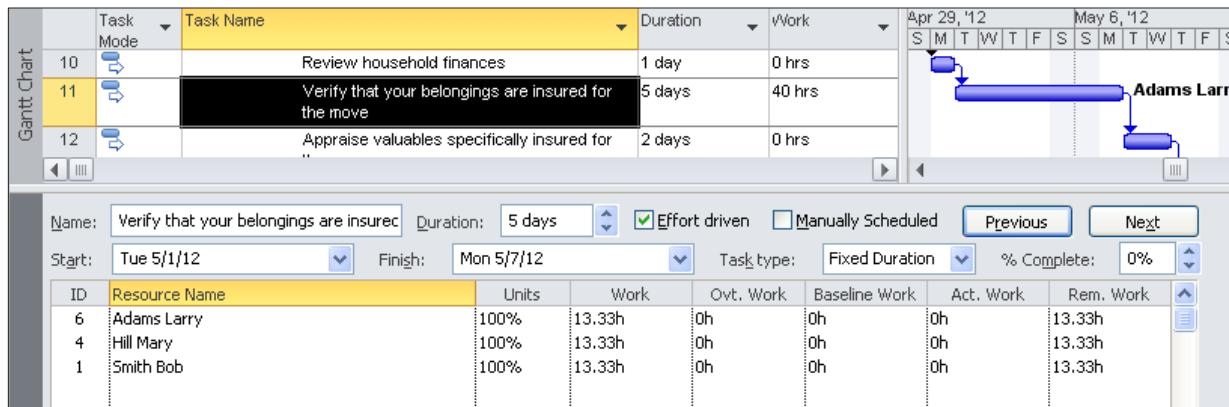

Figure 9-10 PLACEHOLDER

In the example below, the resources were removed and all 3 resources were assigned at the same time. The 3 names were selected and then OK was clicked. Note that each resource is assigned at 100% to the task. The total amount of work is 120 hours and will carry a higher cost due to the increased hours. Any additional resources assigned to this task will take a portion of the original 120 hours.

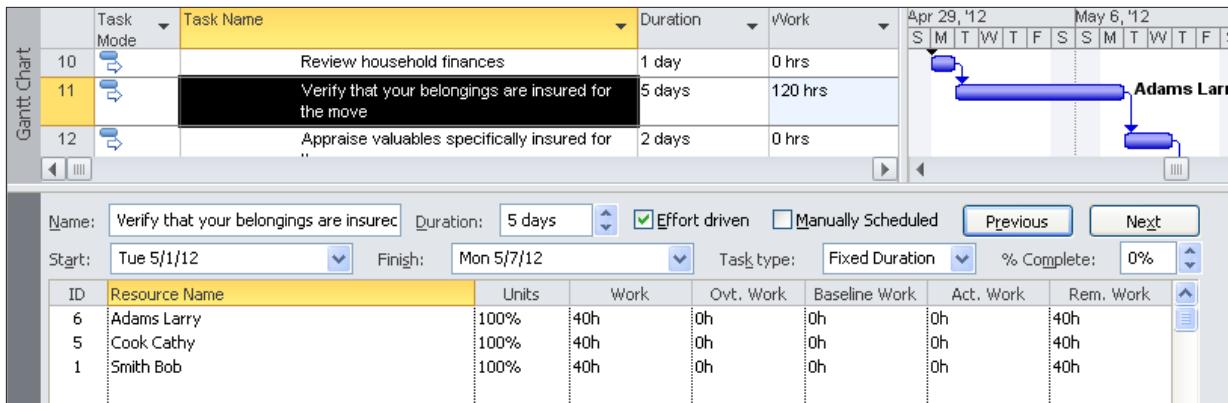

Figure 9-11 PLACEHOLDER

Fixed Unit Assignments

When creating fixed unit assignments, the amount or quantity of the resource assigned to the task is fixed and will not change.

In the examples below, the Resource Sheet entries for each resource are Max Units of 1 or 100% and \$100 per hour is the Standard Rate. Each resource also has 8 hours per day on their availability calendar.

The following examples will use the Task Entry view with the Work subview in the lower pane.

In the example below an automatic scheduled task called “Determine the best method of moving” is a fixed unit, effort-driven off task with a duration of 5 days. Work is zero and the original schedule dates are April 23-27, 2012. The view below shows the subview in the Task Form of Work.

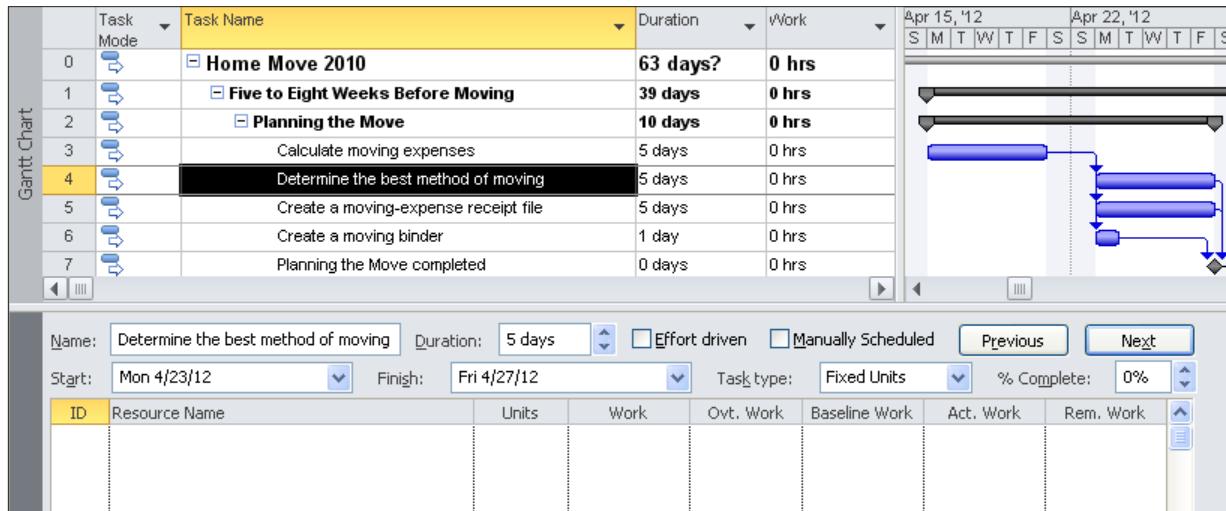

Figure 9-12 PLACEHOLDER

Click in the Resource Name area in the lower pane of the view and select a resource from the alphabetical list of resources. The button called “Previous” will change to “OK” and was clicked to enter the assignment. Note below the affect of this assignment. Larry Adams has been assigned

to the task for 40 hours of work. There are no changes to the dates or duration of the task.

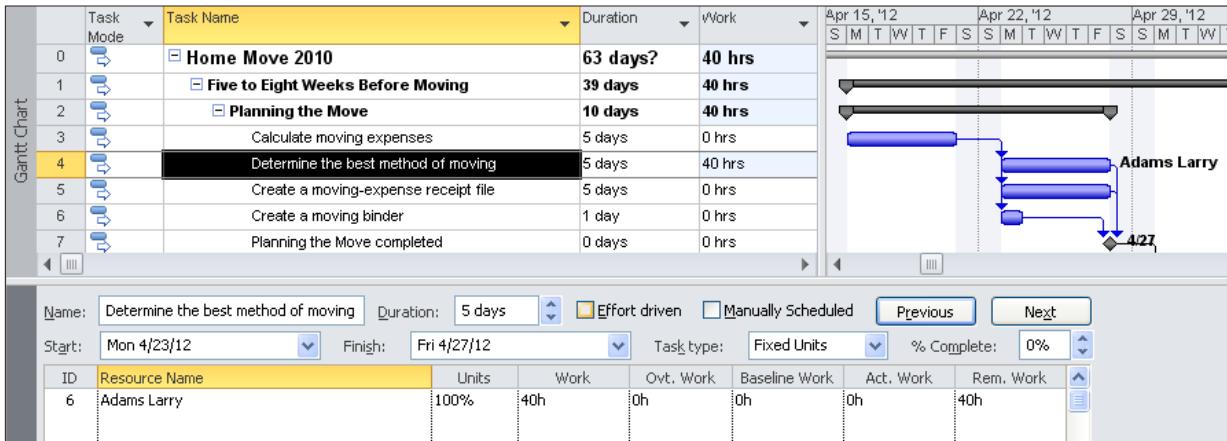

Figure 9-13 PLACEHOLDER

Assigning a second resource to the task will increase the hours to 80 hours and the duration is unchanged. There is an increased cost to the task for the additional 40 hours of work:

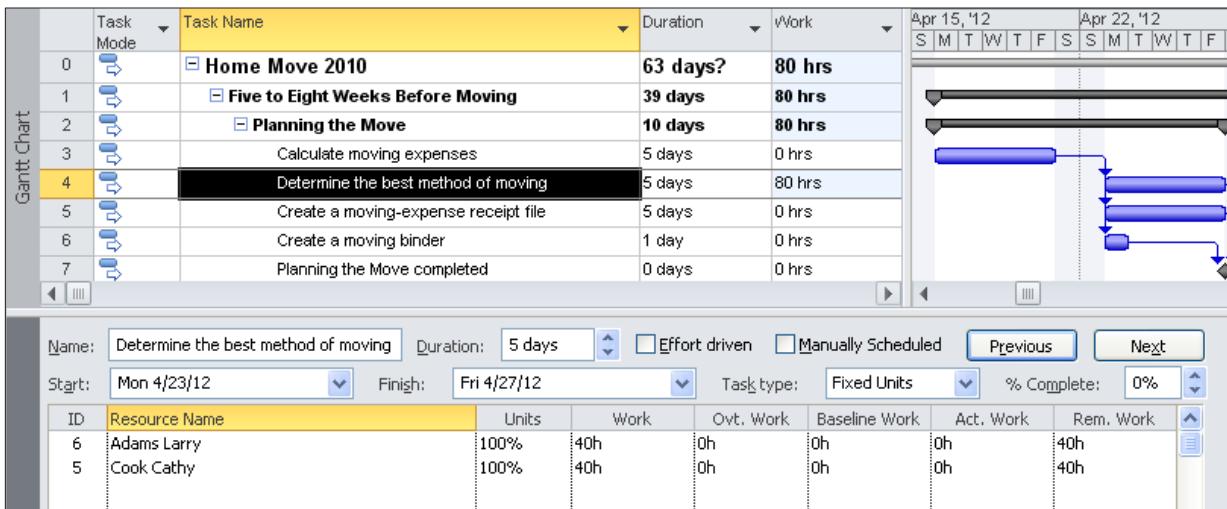

Figure 9-14 PLACEHOLDER

In the next example, the resources have removed from the assignment. An easy way to remove all resource assignments is to click on the top resource name and click the **Delete** key on the keyboard until the assign-

ments are removed. Click **OK** to update.

In the example below the situation is exactly the same as the first example above except the effort-driven flag has been turned on. The first assignment has been created.

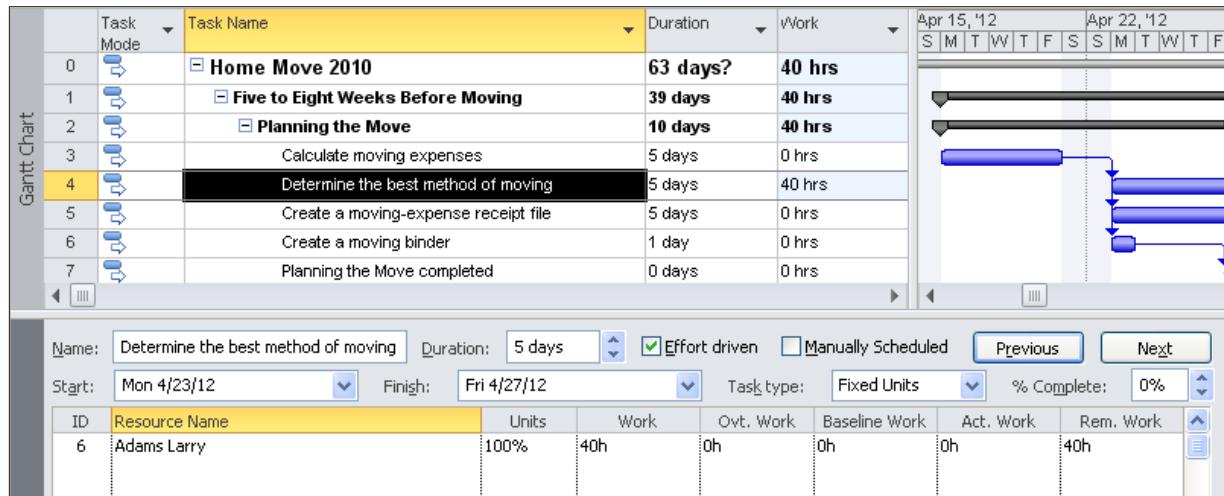

Figure 9-15 PLACEHOLDER

With only one resource, this assignment will look the same as the first example. Dates have not changed and the work is 40 hours. If a second resource is added, the total work of the task is 40 hours and will now be divided between the 2 resources assigned to the task. The task duration has been changed to 2.5 days from the original 5 days and the ending date is now April 25.

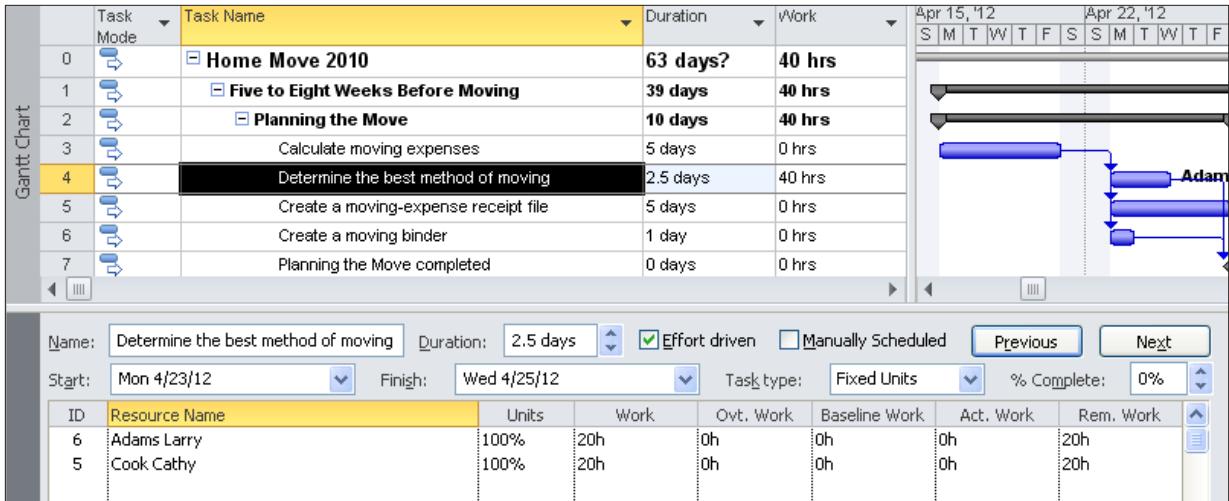

Figure 9-16 PLACEHOLDER

A third resource is assigned to the task. The work is again divided between 3 resources with each working 13.33 hours on the task. The task duration has again changed to 1.67 days and the task now ends on Tuesday, April 24. As additional resources are assigned to the task the work will continue to divide among the resources.

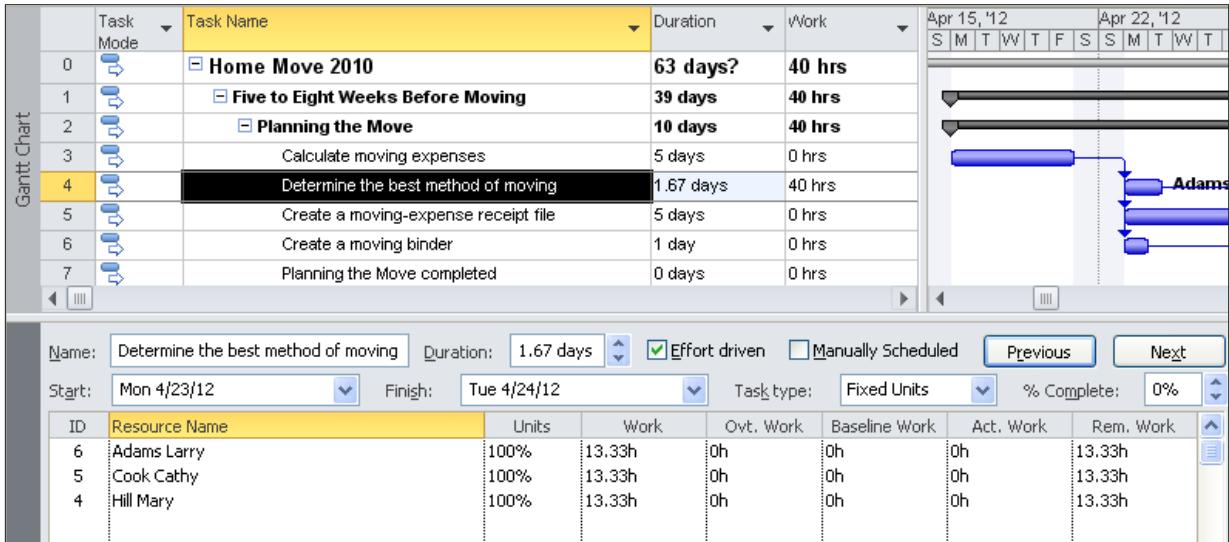

Figure 9-17 PLACEHOLDER

Multiple changes may be made in the Task Form and all changes will be updated when the ok button is clicked. This is usually not a concern for non-effort-driven tasks. However, for effort-driven tasks this will result in a difference in the amount of work assigned to a task. In the previous effort-driven task example, each resource was added one at a time clicking ok after each addition to update the assignment. In the example below, all resources were deleted. All 3 resources were added to the task and then the ok key was clicked and all 3 additions were updated simultaneously. 120 hours of work was calculated for the task for this example. The number of hours is calculated based on the first transaction. Subsequent transactions will divide the number of hours over all of the resources.

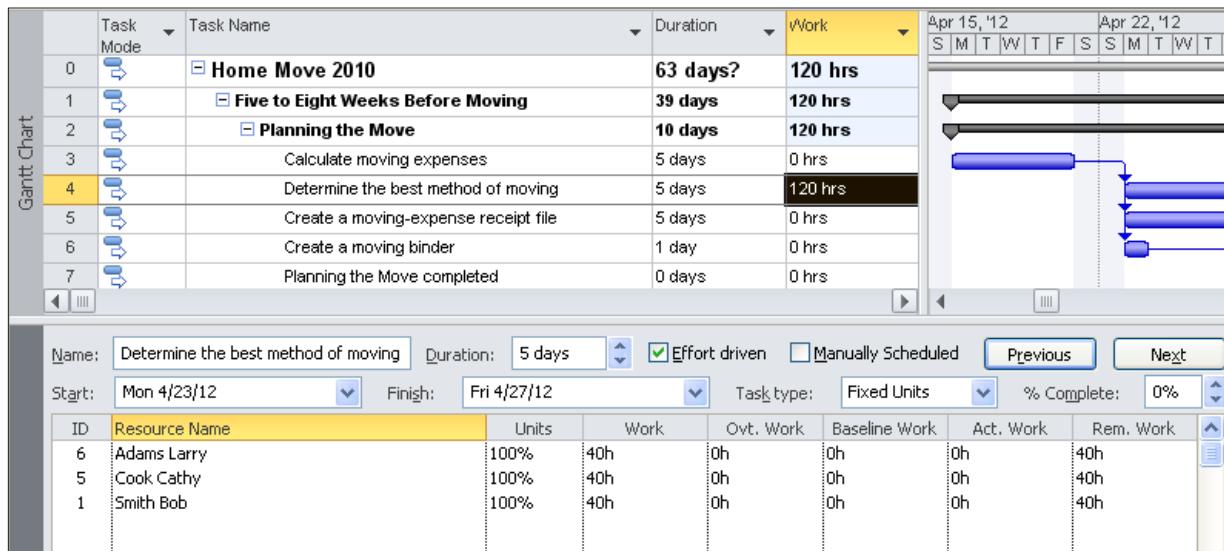

Figure 9-18 PLACEHOLDER

Care needs to be taken in creating effort-driven assignments as they could have a substantial impact on resource allocations and cost estimates for a project. Using other assignment views will not allow the scheduler to see the results of an assignment.

If the automatic calculation for an assignment returns an incorrect hours result for a task, do not hesitate to enter the number of work hours for a resource to correct the values. Click ok to update the changes.

Right clicking in the Task Form in the bottom pane will return options to see the assignment using other views. The Cost and Schedule views are very helpful to see the resource costs or dates when tasks are scheduled.

Group assignments: To create assignments for more than one

resource within a group, increase the value in the unit's column.

Example: 3 Helpdesk workers are needed to work for 5 days (40 hours each). Enter 3 in the units field in the Work view. The result will be 3 people will provide a total of 120 hours of Helpdesk labor for the task.

Generic resources: When the actual resource is not known, assign a skill type or generic resource to a task as a holding value. Using a generic resource will create the demand for the resource and add an estimated cost to the project schedule. When the human resource is acquired, substitute the human resource name for the generic name on the Resource Sheet and all assignments will transfer to the human resource.

When using generic resources, the default base calendar is used to schedule the resource. When a human resource is substituted for a generic resource and their availability is taken into consideration, there is a high probability that the tasks will lengthen. As a rule of thumb, projects could double in length when human resources are substituted for generic resources.

Chapter 10

Fine Tune the Project Schedule

Applying Groups and Filters to Views

Most views in Project contain a table which provides a collection of columns/fields for display. These fields can be used to further refine the information displayed and potentially printed. Grouping and filtering are techniques to refine a view.

A group is a way to categorize and view information. A filter is a way to provide a subset of a collection of data. Filters hide rows of information that do not meet the condition of the filter. A highlight filter is an alternative to a regular filter and it is used to display all information, but visually shade the rows that meet the filter condition.

Groups and filters can applied together or separately.

If you apply a built-in group or filter option, you can tailor a view even if the field(s) used is not displayed.

Filters apply to information that is currently displayed. If you have a previous filter applied or an outline level applied, your filter may not produce the desired results.

How to Apply a Group

1. Click the **View** tab
2. Click the drop-down arrow on **No Group** in the Data group
3. Click the desired group or click **More Groups**

How to Apply a Column-Based Group

1. Locate the column/field you wish to group on
2. Click the drop-down arrow on the column heading and click **Group by** to display a menu of choices
3. Click the desired option

Click the column heading to select it and then click the drop-down arrow to generate a new choice Group on this field.

How to Remove a Group

1. Click the **View** tab
2. Click the drop-down arrow on **Group Name** in the Data group
3. Click **No Group** or **Clear Group**

How to Apply a Filter

1. Click the **View** tab
2. Click the drop-down arrow on **No Filter** in the Data group
3. Click the desired filter or click **More Filters**
4. If a dialog box appears requesting specific information, complete the information and click **OK**

How to Apply an AutoFilter

1. Locate the column/field you wish to filter on
2. Click the drop-down arrow on the column heading and select or deselect the appropriate check boxes to set the filter conditions
3. Click **OK** to apply the filter

How to Apply a Highlight Filter

1. Click the **View** tab
2. Click the drop-down arrow on **No Highlight** in the Data group
3. Click the desired filter or click **More Filters**
4. If a dialog box appears requesting specific information, complete the information and click **OK**

How to Remove All Filters

1. Click the **View** tab
2. Click the drop-down arrow on **Filter Name** in the Data group
3. Click **No Filter** or **Clear Filter**

A fast way to remove all filters is to press F3.

What are Groups?

A group is a way to categorize and view information. A filter is a way to provide a subset of a collection of data.

Built-in Groups

Groups and filters can applied together or separately.

Table 10.1 Task Groups Provided by Default

Group name	Fields/Columns using in the Group
Active vs. Inactive	Active
Auto scheduled vs. Manually scheduled	Task Mode
Complete vs. Incomplete	% Complete
Constraint Type	Constraint Type
Critical	Critical
Duration	Duration
Duration then Priority	Duration, Priority
Milestone	Milestone
Priority	Priority
Priority keeping outline structure	Project, Outline number, Priority
Resource	Resource Name

Work Incomplete	% complete, Work	
Work Overbudget	Work v Baseline Work	

Sorting Tasks or Resources in a View

Project initially arranges tasks according to ID number which is located in the far left column of the Gantt Chart view. To make it easier to work with your tasks, you may want to temporarily or permanently rearrange them. You can rearrange the order of tasks based on a particular type of information, including start date, finish date, priority, cost, and ID.

When you sort a project that contains summary tasks, Project maintains the outline levels and bases the sort on the summary task values. For example, if you sort a group of summary tasks by start date, Project bases the order on the start date of each summary task. Project then sorts the tasks within each summary task.

You can also sort resources in most resource views. By default, resources are arranged in ascending order based on the ID number, but you can sort resources by cost or name.

You can also perform a custom sort by specifying up to three sort fields. Sorting by more than one field is helpful when more than one task contains the same information in some fields. For example, if you sort by the duration and more than one task has the same duration, you can

determine the order of those tasks by sorting by an additional field, such as the start date.

To sort information within a view:

1. Click the **View** tab
2. Click the drop-down arrow on **Sort** in the Data group
3. Click the desired option or click **Sort By** for more options

How to Sort Information

1. Click the **View** tab
2. Click the drop-down arrow on **Sort** in the Data group
3. Click the desired sort option or click **Sort by**

Choosing Permanently renumber tasks in the Sort By dialog box will renumber all rows in the view. This option is not recommended in a task view, such as Gantt Chart , since that will permanently change the order of items in your schedule.

How to Apply a Column Based Sort

1. Locate the column/field you wish to sort on
2. Click the drop-down arrow on the column heading and select **Sort A to Z** or **Sort Z to A**

How to Reset a Sort Back to Default

1. Click the **View** tab
2. Click the drop-down arrow on **Sort** in the Data group
3. Click **by ID**

Critical Path

What is a Critical Path

The Critical Path is the longest path of tasks through the network of tasks for the schedule. It represents the timeline of the schedule and establishes the end date for the project. It is the minimum time that it will take to complete the project. Tasks not included in the network of tasks will not be included in critical path calculation.

For a more accurate critical path calculation, all tasks should have a predecessor and a successor except the first and last tasks of a project.

Checking the contents of the predecessor and successor columns to make sure all tasks have valid entries is helpful.

Any task on the critical path is known as a Critical Task. If a critical task slips, the end date of the project will be negatively affected.

Scheduling factors contributing to the Critical Path calculation include:

- Relationships between tasks
- Lead and Lag time
- Duration of tasks
- Constraints
- Task Calendars
- Resource Availability
- Resource Assignments

Project will automatically recalculate the critical path each time a task is changed. The calculation is making a forward and backward pass through the schedule looking for time gaps between tasks. This time gap is called slack which is also known as float. If a task has slack, it is considered non-critical. When a task has no slack, it is considered critical. Slack

can be both a positive or negative value.

Every project schedule should include float or slack in order to address contingencies. No project will run exactly as planned. Float or slack will provide the extra time needed to handle unknown problems that will arise during the execution of a project.

There are 2 types of slack calculated in Project 2013:

- Total slack is the amount of time a task can slip without affecting the end date of the project.
- Free slack is the amount of time a task can slip before it affects its immediate successor task. If a task only has one successor, free slack will be the same as total slack.

This type of critical path calculation is based on tasks.

Resources can also be critical within a project schedule. During the execution of the project, different resources will become critical at different points within the schedule. If a critical resource is not available at a critical point, the entire project could be affected as well as the ending date.

Frequently, during the execution of a project, a task that was not originally on the critical path will become critical. Careful tracking and monitoring of the critical path during the management of the project will help keep the project manager on track to achieve the goal of the projected end date.

Formatting Views to Display Critical Path

Slack is essentially scheduling breathing space for a project and occurs when a particular task can be delayed without affecting the end of the project. The greater the slack, the more breathing space you will have to help manage problems that may occur during the performance of the project. If a schedule fails to include slack, the plan for the schedule might be unobtainable. Since projects are typically never performed exactly as sched-

uled, slack becomes essential to achieving the goal date for the project.

Each time a task is changed in Project, the critical path is recalculated automatically.

Project provides the ability to format the Gantt Chart view to identify critical tasks and tasks with slack time.

To turn on Critical Task and Slack formatting:

1. Click the **Format** tab
2. Click **Critical Tasks** and click **Slack** as desired in the Bar Styles group

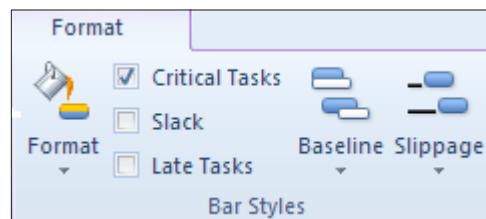

Figure 10-1 PLACEHOLDER

The critical path is shown as red Gantt bars and the non-critical tasks appear a blue Gantt bars. Once you have displayed the critical path, you will have a better understanding of the specific tasks which are driving the ending date of your project schedule.

Shortening the Critical Path

Viewing Resource Assignments

Once assignments are created, refining them and looking at them from different points of view is not only helpful but necessary. If resource allocations and future resource demands are your goals for using Project, taking a deeper look at the results of how the assignments were created will be essential.

Resource Usage View

The purpose of the Resource Usage view is to allow viewing and updating of assignments from the resource point of view. This view displays all assignments created for a resource as well as assignment details. Information may be viewed at any level of timescale detail that is appropriate for your project.

You will be able to use this view to answer the following questions:

- How much availability does a resource have?
- What is the cost of having a resource work on a task?
- Are all of the tasks assigned to a resource?
- How many hours is a resource assigned to a task?
- Is a resource overallocated? (Overbooked)
- What is the future demand for a resource for this project?
- What is the total number of hours for a resource assigned to the project?

The Resource Usage view may be used for resource work distribution worksheets. When this view is printed, a timeframe may be added to allow for more focused printing. Insert a page break between resources to print separate reports for each resource.

Task Usage View

Task Usage view is very similar to the Resource Usage view, however, the content is shown from the task perspective. Each task is displayed with the resources assigned to the task. The scheduler will be able to see a complete picture of the details of assignments. This view may also be used for changing or fine tuning assignments. Information may be viewed at any level of timescale detail that is appropriate for your project.

- What resources are assigned to a task?
- Which tasks do not have a resource assigned?
- What is the total cost and number of hours of a task?
- What is the remaining work of a task?
- What percent allocations are my resources assigned to tasks?
- What is the distribution of work for all the resources on the task?

How to Display Resource Usage View

1. Click the **View** tab
2. Click **Resource Usage** in the Resource Views group

How to Display Task Usage View

1. Click the **View** tab
2. Click **Task Usage** in the Tasks Views group

How to Adjust Information in the TimePhased Grid on Resource Usage or Task Usage View

1. Click the **Format** tab
2. Click **Add Details** in the Details group
3. Select the desired field(s) on the left and click **Show** or select the desired field(s) on the right and click **Hide**
4. Click **OK** to apply the changes

Team Planner View

The purpose of this view is to show resources and their assignments using a Gantt style format. The team planner view will help the scheduler identify overallocations within the schedule, level workloads, reassign resources to tasks and identify problems in the schedule from the resource point of view.

Team Planner view is only available in Project 2013 Professional.

Team Planner view is divided into 2 sections. The upper section contains one row for each resource, with bars to the right representing assigned work. The lower section contains bars representing tasks without resources.

How to Display Team Planner View

1. Click the **View** tab
2. Click **Team Planner** in the Resoure Views group

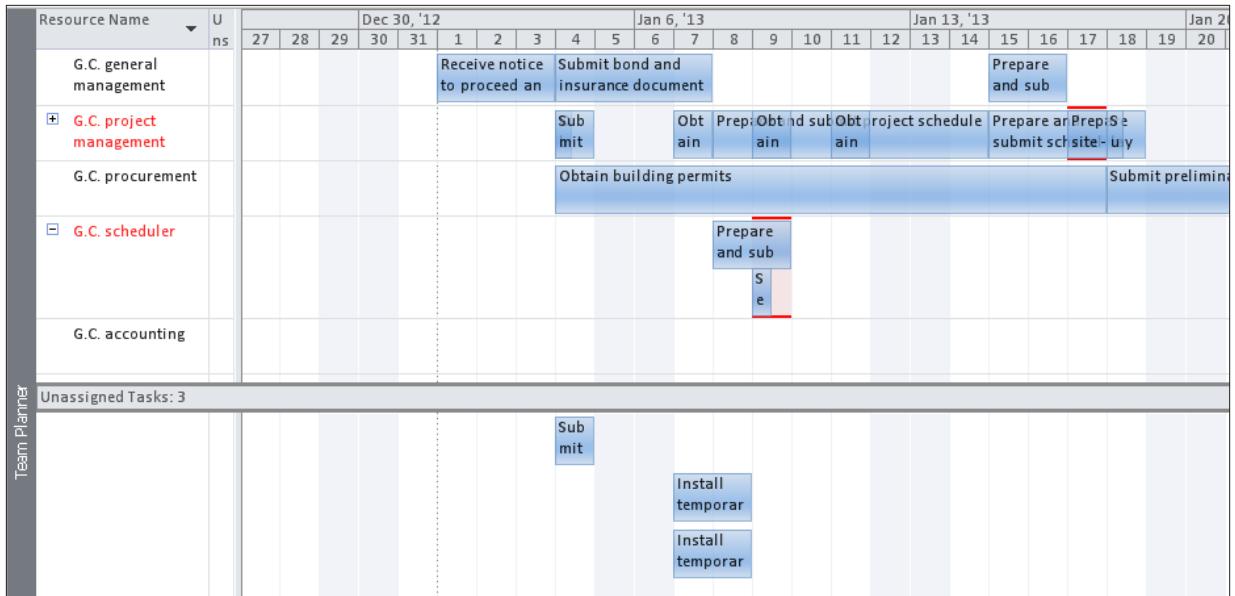

Figure 10-2 PLACEHOLDER

Below is a chart to help with understanding how to interpret the informationin the view:

Table 10.6 Team Planner View Legend

Feature	Description
A vertical orange line	Today's date
Tasks colored in darker blue	Progress on the task
Teal colored tasks	Manually scheduled tasks

Table 10.6 Team Planner View Legend

Feature	Description
Gray colored tasks	External tasks
Light blue colored tasks	Un-started tasks
Gaps in timelines for resources	Under-allocated resource or unavailable
Red lines on the top and bottom of the task	Overallocated tasks
Resource name in red	Overallocated resource
Task bars colored black	Tasks that are late
Shaded day on calendar	Non-working day for the resource. This data is coming from the resource availability calendar
Top pane – pink blocks of time	Overallocated time

Below are some of the mouse shortcuts that will help you work with the information in this view.

Table 10.7 Mouse Shortcuts for Team Planner View

Action	Result
Double click the resource name	Resource Information dialog box
Double click a work task bar	Task Information dialog box

Table 10.7 Mouse Shortcuts for Team Planner View

Action	Result
Timescale density	Adjust as needed – lower right corner
Hover over task	Pop up of task details
Double click on timescale	Opens the timescale box to alter scale values
Right click on a task	More options:
Right click on an assignment – Reassign to:	This option presents a list of all resources in the schedule, including resources already assigned to the task. Select a resource to reassign to the task or select unassigned option and all assignments will be removed from the task.
Right click on an assignment – Inactivate:	Task will disappear from the Team Planner view. To reactive, return to Gantt chart view.

Only active tasks will show in the team planner view.

Leveling and Views that Show the Assignments

Understanding Overallocations

Each resource is assigned a calendar when entered on the Resource Sheet. The calendar is customized to contain the availability of the resource. When more work is assigned to a resource than time available on their resource calendar, the resource is considered to be overallocated. The overallocation calculation is looking at resource assignments on a minute by minute basis. If a resource is overbooked for even 1 minute, the resource is considered overallocated.

When a resource is overallocated, a red person symbol appears in the indicator column. This indicates that there is an overallocated resource assigned to the task but will not indicate which resource is affected. Even though resources are overallocated, assignments can continue to be created.

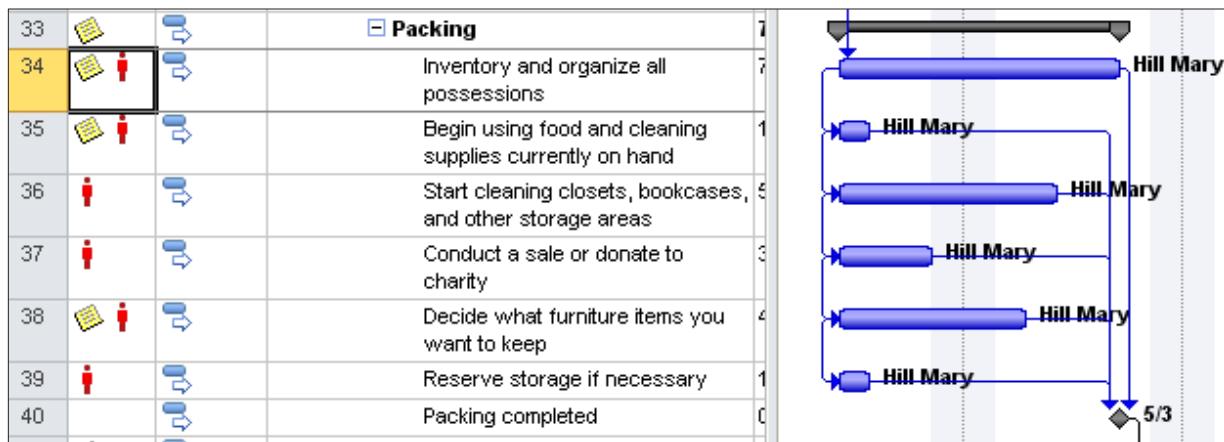

Figure 10-3 PLACEHOLDER

Real World Application of Scheduling: Shortening the Schedule and Resolving Resource Conflicts

Scheduling involves not only creating a detailed schedule and assigning resources, but it involves modifying the schedule to meet goals and to work with limitations. Typically there is a goal to complete the schedule on time and a common limitation is availability of resources. This section will address those areas.

Shortening the Schedule

Once you create your schedule, arrange the tasks, and assign resources to the tasks, you may realize that the schedule does not meet your original goals. You may have a deadline or a budget that you must meet. Listed below are several ways to shorten your schedule. The method you choose depends on your individual project and resources.

The best way to shorten your project is to shorten the critical path. The critical path includes those tasks that affect the duration of the project. If a critical task finishes late, it delays the entire project. If a critical task finishes early, it shortens the duration of the project. If you shorten the length of the critical path, you shorten the duration of your project, and your project finishes sooner.

Some options to consider for shortening the project schedule are:

- Assign additional resources
- Assign a resource to work overtime
- Increase working time (calendar)
- Break task into smaller tasks
- Overlap key activities (multi-tasking)

- Delete tasks
- Redefine quality (less time on activities)
- Break project into phases
- Change dependencies of tasks

Resolving Resource Conflicts

The most common resource conflict is that a resource is overallocated. This means they have more work assigned to them than they can realistically complete in the given time frame.

While there are multiple ways to manage resource allocation, it is important to find and analyze resource overallocation and evaluate the overall effect on the project schedule.

Some options to consider for solving resource conflicts are:

- Hire additional resources
- Replace a resource on a task
- Assign a resource to work overtime
- Increase work time (calendar)
- Break a task up and move a portion of a task till a resource is available
- Delay the entire task until a resource is available
- Adjust the division of work across the task (work contour)
- Move or create a constraint on the task until the resource is available
- Delete tasks
- Change overlapping tasks into sequential tasks
- Use Project's leveling feature
- Use Task Inspector to solve the problem
- Use Team Planner to solve the problem

Notice the similarly with features already mentioned to shorten the schedule.

Views to Identify Overallocations

There are several views in Project that will help analyze resource overallocations. After an overallocation situation is discovered, research should be carried out to understand where the overallocation exists.

The views below will help locate these problems:

- Gantt Chart view
- Resource sheet
- Resource graph
- Resource allocation view
- Team Planner
- Task Usage view
- Resource Usage view

Techniques to help work with overallocations will be illustrated next.

You may have already discovered some of these on your own while using Project.

Using Indicators

In the Gantt Chart view, you will immediately be notified if there is an overallocated resource on a task when the red stick figure appears. If you hover the cursor on this icon, the display indicates resources are overallocated.

This indicator is a handy and quick visual cue to identify overallocated resources.

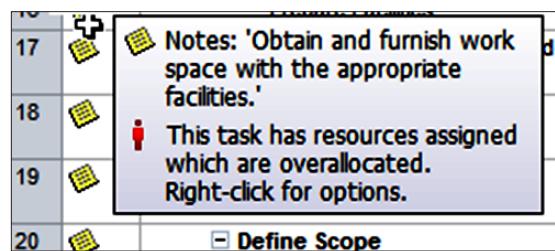

Figure 10-4 Overallocated Resource

Using the Resource Allocation View

The Resource Allocation view is a combination view that shows resource assignments in a Resource Usage pane along with a personal Gantt chart in the lower pane. The advantage of this view is you can see both numerically and visually what a resource is working on and use either the upper or lower pane to quickly make modifications.

To use the Resource Allocation view to identify resource commitment issues:

How to Display Resource Allocation View

1. Click the **View** tab
2. Click the drop down arrow on **Other Views** in the Resource Views group
3. Click **More Views**
4. Click **Resource Allocation**
5. Click **Apply**

Methods for Resolving Resource Conflicts

In this section, you will be exposed to many different methods for analyzing and resolving resource conflicts. It will be up to you to determine the correct mix of options for the schedule. Some methods will be more manually driven, while other methods will take advantage of some automatic features in Project. Methods that are more automated may have more of a ripple effect that aren't expected so be sure to carefully choose the appropriate method. This list of methods is not meant to cover every possible scenario, but instead is presented to give suggested scenarios that are popular and easy to use. No order of priority is indicated with this list.

Using Indicator Suggestions

For tasks that have a red stick figure in the indicators column, that means there is a resource conflict on the task. You can use shortcuts in Project to help fix that. Simply right click on the indicator field or name of the task and apply one of the options listed such as: **Fix in Task Inspector** or **Reschedule to Available Date**.

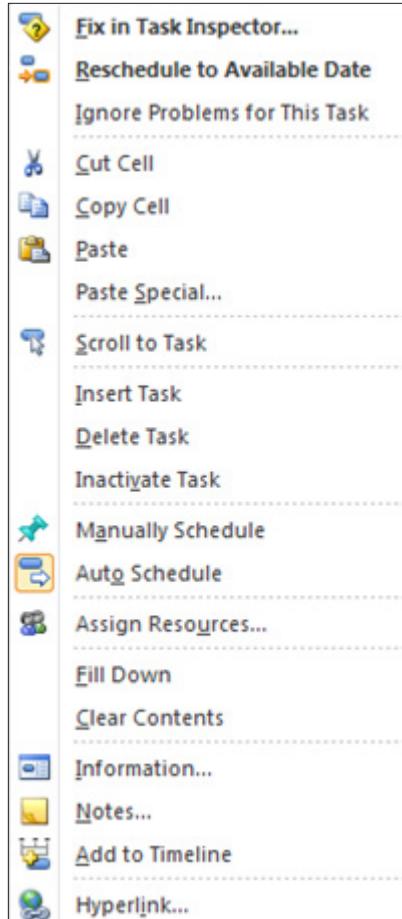

Figure 10-5 Context Menu from Overallocated Resource

Using Task Inspector

Another option to evaluate and solve problems with the schedule is Task Inspector. Using this option gives you a pane to the left side of the Entry table. The advantage of Task Inspector is it provides critical information about the task and information about what is occurring at a specific time

and gives you options to correct any issues, including hyperlinks to the feature or area where you can make a change.

How to Apply Task Inspector

1. Click the **Task** tab
2. Click **Inspect** in the Tasks group

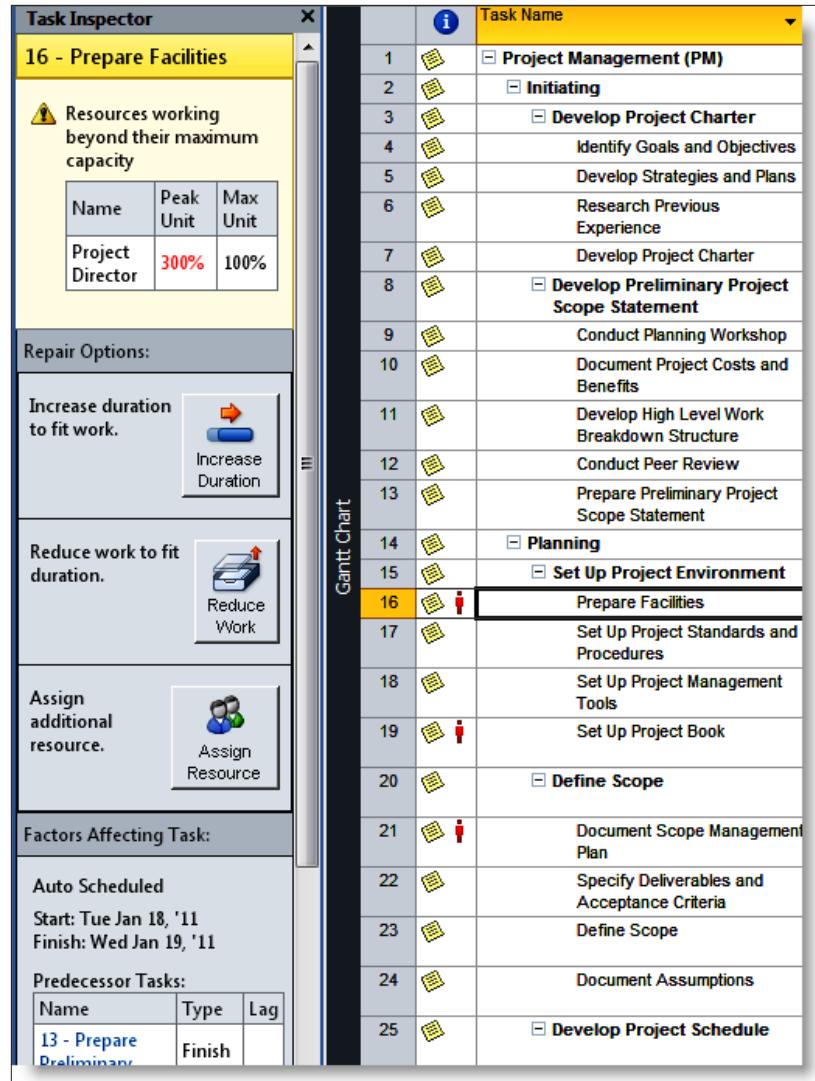

Figure 10-6 Task Inspector

Don't forget to consider the ripple effect of making a change to one task. As other tasks respond to this change, you may see a change in the critical path or introduce other resource conflicts.

Changing Resource Assignments

When you look at resource assignments individually, you might see that one resource is very overworked; however, when you look at resources collectively, you might notice that some resources are underworked. One of the best ways to solve resource issues is to more equitably distribute the work. For example, Ricardo is assigned to a task at 150% while Angelica is assigned to a task at the exact same time at 25%. If you can find a way to shift some of Ricardo's work to Angelica, you will take better advantage of the availability of both resources. Changing assignments can be done in many different views such as Task Usage or Resource Usage view.

When you return to the Resource Allocation view, it will recalculate and remove that task from the resource you had selected. You may need to reselect that resource again if you want to see an updated lower pane and be able to continue making adjustments.

Move a Task Until a Resource is Available

Sometimes the resource assigned to a task is the only person with the skill set that can do the work. In this case the only option is to move the task until the resource is available. One technique for moving a task is to shift by a time period (e.g. week), another technique is to reschedule the task until the resource is available.

Moving a task will create a constraint on the task. To delay a resource assignment:

How to Move Tasks to Account for Resource Limitations

1. Select the desired task (click on the row ID number or task name)
2. Click the **Task** tab
3. Click the drop down arrow on **Move** in the Tasks group
4. Click the desired option

Assigning a Work Contour

When you assign a resource to a task, Project spreads the work out evenly over the duration of the task unless you specify otherwise. For example, if you assign a resource 100% to work 80 hours on a ten-day task, Project assigns eight hours of work per day. This is a flat contour.

Not all tasks require that the work be spread equally (a flat contour). For example, consider the building of a fine custom wooden cabinet, which is one task in a project that involves furnishing a house. The carpenter purchases the wood and other components, which requires trips to several specialty stores. He spreads the trip out over several days, while using some of his time to finish his previous project. Then he works full days for three weeks cutting and assembling the cabinet. In the middle of construction, he puts in some overtime.

After the construction phase is completed, he stains the wood, which takes two hours. The stain has to dry overnight. The next day, he applies a coat of varnish, which takes two hours. It, too, has to dry overnight.

The next day, he sands the varnish and applies another coat, which takes three hours. He applies three more coats of varnish, repeating the progress.

On the last day, he buffs the final coat, which takes an hour. Most of the work on the cabinet occurs during the middle of the project, peaking during a few days of overtime. Work at the beginning and end of the task is part-time.

You can change the work contour by manually modify the working hours in the timephased grid on the right side of the Task Usage or Resource Usage views.

Using the Team Planner View

The Team Planner view is very visually pleasing and allows you to manage your schedule by resources instead of by task. Overallocations can be quickly corrected here and the impact on the resource or other resources is also quickly visible.

To use the Team Planner View to solve an overallocation:

- Locate the task that is causing a conflict (red lines above/below highlight the task), and simply drag the task to a new time period for the same resource or drag it to another resource.

Optionally – You can right click on the task and take advantage of features available in the short-cut menu (such as reassign to another resource).

Resource Name	Unscheduled Tasks	Jan 9, '11					Jan 16, '11					Jan 23, '11											
		W	T	F	S	S	M	T	W	T	F	S	S	M	T	W	T	F	S	S	M	T	W
Project Director				Ide ntif			De vel		Co nd						Pre par								
Project Manager								Resear ch	D evel	D evel				Co nd	P ar		Set Up	Set Up	Project Book	Do cu	Sp ecial	Defin	
Acceptor									D e						P r								
Application Architect																							
Technical Architect																							
Quality Assurance Manager																Set Up							

Figure 10-7 Team Planner View

The Team Planner view is also an easy way to assign tasks that currently do not have resources assigned to them. Unassigned tasks will appear at the bottom of the Team Planner view and can be dragged and

dropped to the appropriate resource.

Dragging a task to a new location will create a constraint on that task since you are essentially forcing it to happen a particular time. If you want to avoid constraints, use the Gantt Chart view and make other adjustments such as changing links or reassigning tasks.

Applying Leveling Features

Leveling is a feature in Project that can be used to solve overallocations. While the software can't dream up a creative solution, it is able to shift, delay, and split tasks to take advantage of open spaces in your project where resources might be underallocated or where tasks can be delayed without shifting the end date. Should you choose, you can also indicate that your end date is flexible so there are more options for leveling to correct overallocations. Before you use leveling, be sure to consider the following scenarios and options.

These are three leveling scenarios you can choose:

Level Selection – use this option when you are in a task view and want to fix overallocated resources on specific tasks. This will leave overallocations for those same resources on other tasks untouched. Typically this option can help when you need to make sure you meet your commitments on the selected task(s), but do not want to address other tasks at the same time.

Level Resource – use this option when you are in a resource view and want to fix overallocations by resource. This choice would be suggested when you know that the availability of a specific resource will not change and you have to get the work done using this limited availability.

Level All – this option is when you want to fix overallocations across the entire project across all resources.

When you click Leveling Options, the following dialog box appears:

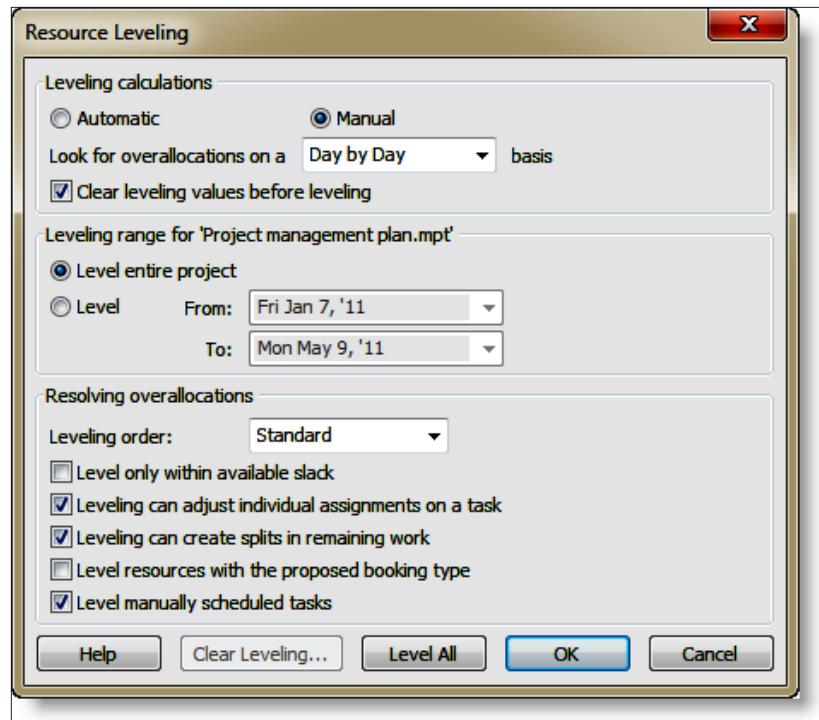

Figure 10-8 Resource Leveling Diagram

Please consider the following when selecting your options:

- Automatic is not recommended since it will level your project continuously without warning. Tasks will be delayed before you realize anything has happened.
- While Project offers an auto leveling feature to resolve overallocation, it is recommended that the project manager resolve overallocation manually. Overallocation can be a complex issue and requires analysis. Utilizing the auto leveling feature can diminish your ability to analyze and uncover the root cause of the overallocation.
- Consider changing Leveling order to “Priority, Standard” if you have set priority numbers on your tasks.
- Best Practice – Only use priority numbers to lock exception tasks down. For example, setting a task to a priority number of 1000 will make sure that the task does not move when you level. Essentially you are setting the task to be highest priority.

The Team Planner view is an interactive format allowing you to drag and drop activities directly on the right portion of the screen to alleviate

overallocations. Also of note is that unassigned tasks will appear at the bottom and can be assigned to resources by dragging and dropping them on the grid on the right.

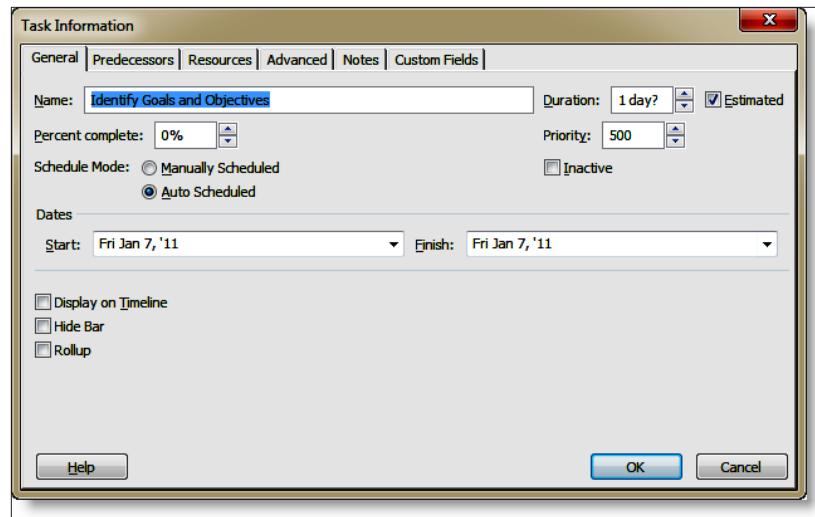

Figure 10-9 Task Information Dialog – General Tab

- “Level only within available slack” attempts to delay only non-critical tasks. The drawback to this feature is it limits Project’s ability to fix things.
- Best Practice – Run leveling first with the “Level only within available slack” option enabled to protect your critical path and observe the benefits before turning this option off and running leveling.
- “Leveling can adjust individual assignments on a task” means when a task is staffed with multiple resources, Project has the flexibility to move work resource by resource instead of moving the entire task and all resources at once.
- “Leveling can create splits in remaining work” means a task can be split as needed to get around other tasks that can’t be moved.

Be sure to review the splits created in your Project and undo the action if necessary. For example, if the result of this is a task that is split into 10 pieces, this is probably not a good result.

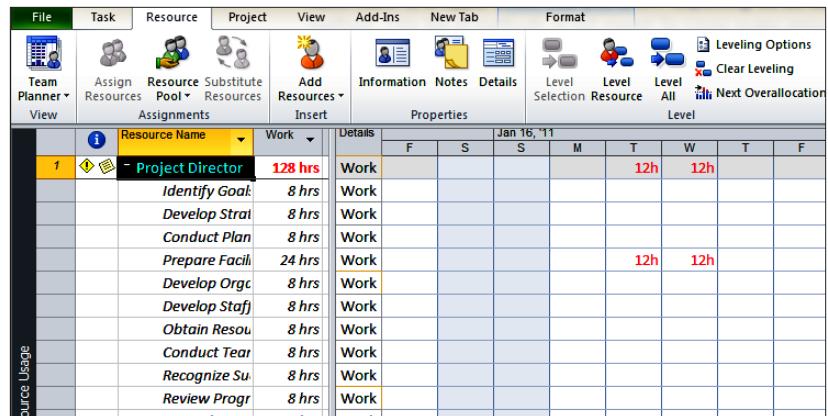

Figure 10-10 Leveling

To level your project:

How to Apply Resource Leveling

1. Click the **Resource** tab
2. Click Leveling Options in the Level group
3. Choose desired options and click **OK** to save the settings or click **Level Now** to apply resource leveling immediately

To level by a specific resource, click **OK** on the leveling options and click **Level Resource** to choose a specific resource.

How to Clear Resource Leveling

1. Click the **Resource** tab
2. Click **Clear Leveling** in the Level group

Chapter 11

Baseline and Tracking

The Importance of Baselining

One of the integral parts of the decision making process is being aware of where the schedule stands against its original plan. The baseline is the original plan.

After the schedule has been adjusted, discussed and negotiated with the stakeholders of the project, a schedule will be agreed upon. That original approved schedule will be set as the project baseline. The project baseline becomes the schedule that the metrics for the project will measure against. It is also the plan that the stakeholders are expecting the project performers to adhere to during the project.

When an event occurs to put the project off schedule, the difference between the actual performance values and the baseline values is known as the **variance**. Variances can have either a positive or negative effect on the schedule. Monitoring variances gives the project manager more knowledge regarding the project which in turn results in better decision making to adjust the project schedule if needed or help the project get back on track.

Without a baseline, this knowledge would be lost. You would not be aware of how off track the schedule is from the original planned finish date and you would not have a finish date to manage the schedule against.

Project requires a baseline to calculate earned value. More information about this topic is in the advanced course.

Setting a Baseline

A critical component before you begin tracking is to set the baseline. After your project is formally approved and right before work is ready to begin, setting a baseline will capture information about what you have planned so you can use it as a measure against how the project actually performs. Because it is available for comparison purposes at any point during the project, the baseline provides an effective way to check your progress throughout the project. Project deals with three levels of time when working with projects: baseline, current, and actual.

You should not set the baseline until you are finished entering tasks and creating the schedule. The goal is to have the schedule as complete as possible before setting a baseline for comparison purposes.

The act of setting a baseline creates a copy of the following fields into equivalent baseline fields (e.g., Baseline Start):

- Start
- Finish
- Duration
- Work
- Cost

Baseline information is always maintained unless you set a subsequent baseline again for the entire project. In many cases you will not need to use Baseline 1–10, but very lengthy projects may want to use the additional baselines to capture a snapshot at the end of each year (as an example).

To set the baseline:

1. Click the **Project** tab.
2. Click the drop-down arrow on **Set Baseline** in the Schedule group.
3. Click **Set Baseline**.
4. Click **OK**.

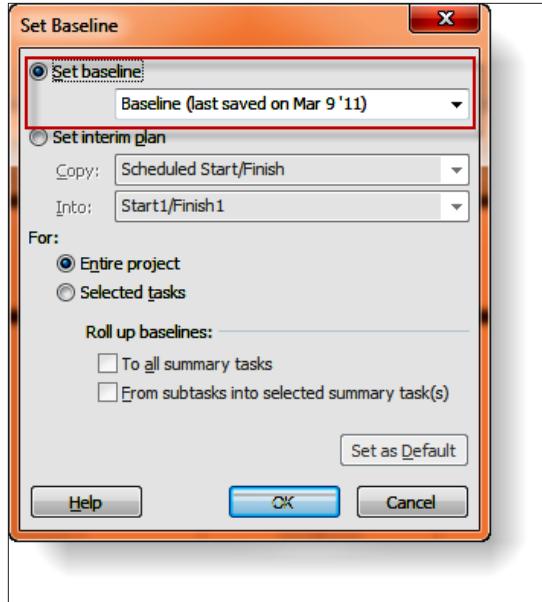

Figure 11-1 Set Baseline Dialog Box – Setting Baseline

To utilize the variance calculations, you must record the current baseline using the first option from the dropdown menu listed as just “Baseline.” Project calculates from this Baseline only. This Baseline is also known as Baseline 0. Baselines 1–10 are for historical purposes only, but you may use any numbered baseline in a view.

As a best practice, create a backup copy of your original baseline data by immediately setting the baseline again and using an empty baseline 1–10. This way even if you accidentally overwrite the information in the first Baseline, you can still retrieve it by going to your backup baseline. This also provides historical information about previous baselines.

Setting an Interim Plan

Setting an interim plan follows the same procedures as setting the baseline except that you chose Interim as the option. The main purpose for the interim plan is to capture historical snapshots of the current state of a

project at specific points in time. The best practice for this feature is to use it for projects that are very lengthy where you might need a snapshot every 6 or 12 months for future comparison purposes. Another alternative use for this feature to extend the number of baselines available to the project manager.

Clearing a Baseline

While it is best practice to maintain copies of baselines for historical purposes, it may be necessary to clear a baseline. For example, a baseline set by mistake.

To clear a baseline:

1. Click the **Project** Tab.
2. Click the drop-down arrow on **Set Baseline** in the Schedule group.
3. Click **Clear Baseline**.
4. Click **OK**.

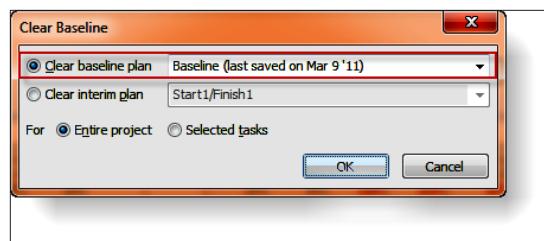

Figure 11-2 Clear Baseline Dialog Box

Updating Baseline

When approved changes are made to the schedule, the changes might result in a change to the baseline. Each organization should have a policy in place as to when or how baselines should be updated. Baselines, at times, are misunderstood by project schedulers and organizations should clarify their policies and intended usage. Management may want to be alerted when baselines have been updated or overwritten.

Baselines updates may include selected tasks, overwriting the existing Baseline 0, or capturing a new baseline in Baseline 1-10 fields.

Project views such as Tracking Gantt view display Baseline 0 as default. If you want another Baseline to display, you will need to modify the desired view.

Updating an Existing Baseline or Capturing an Additional Baseline

1. Select the desired tasks (optional).
2. Click the **Project** tab.
3. Click the drop-down arrow on **Set Baseline** in the Schedule group.
4. Click **Set Baseline**.
5. Choose the desired options.
6. Click **OK**.

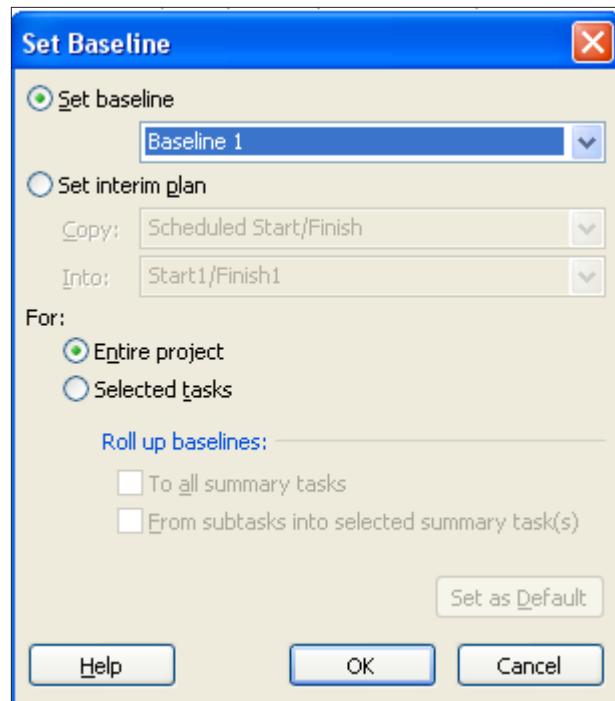

Figure 11-3 PLACEHOLDER

Overwriting Baseline 0 will replace planned task information with current task information and eliminate all historical variance values. Be sure this is your intent before overwriting Baseline 0.

Overview of Tracking

As your project progresses, you should track the completion of tasks to determine if the tasks followed the expected schedule. You often have changes that occur once the project begins. You may, for example, have tasks that must be postponed, tasks that start early or late, or tasks that take longer than expected, so you should update your project often.

When the project is updated, you enter what actually happened. Items to be updated include when tasks start and finish, and how long tasks take to complete. You can also make any necessary changes to the schedule. The schedule is meant to guide you through the completion of the project, but it does not have to be inflexible. The schedule should change as necessary to reflect what is most likely to happen in the project.

There are many different ways to update the status of your project. For each task in your project, you can enter the actual start and finish dates, percent complete, actual duration, remaining duration, and so on, or you can have Project enter the information automatically.

If you enter the percent complete, actual duration, or remaining duration, Project calculates and updates the entries for the other fields. For example, if you specify that a two-day task is 50% complete, Project automatically transfers the current start date into the field for the actual start date, enters the actual duration as one day, and calculates the Cost and Work fields based on the task and resource information. You can change any of the information Project enters automatically.

When you update the information for subordinate tasks, Project automatically updates the summary task. You cannot update a summary task directly.

Tracking Activities With Project

Tracking is one of the simplest functions that you can perform in Project. Unfortunately, most managers have sub-optimized their plans by setting constraints, or they do not understand Effort Driven Scheduling and under-

mine the simple part of tracking actual progress.

Before you begin the mechanics of tracking, there are several things to consider that will affect the tracking process and how variances are calculated.

Setting the Status Date

When you update tasks, some of the automatic tracking features work based on the status date. For example, if uncompleted work on a task is rescheduled, Project uses the Status Date as the current point in time and therefore, the past is to the left of the status date and the future is to the right of the status date.

To set the status date, complete the following steps:

1. Click the **Project** tab.
2. Click date to the right of **Status Date** in the Status group.
3. Choose or type the desired date
4. Click **OK**.

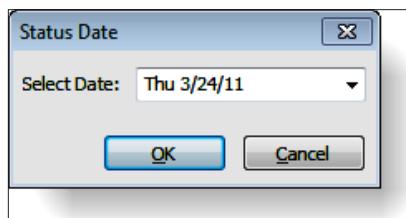

Figure 11-4 Status Date Dialog Box

If you forget to set the Status Date, Project will use the Current Date for any features that typically require the Status Date, such as rescheduling a task and Earned Value calculations.

When you are ready to do the update for the next period, be sure to change the Status Date if you do not want Project to use the Current Date for this period. This is useful when you are a week behind in updating your schedule and you want it to reflect last week's progress.

Displaying the Tracking Gantt View

The Tracking Gantt view displays both the baseline and current Gantt bars for every task and is very useful when doing variance analysis.

To display Tracking Gantt Chart view:

1. Click the **Task** tab.
2. Click the drop-down arrow on **Gantt Chart** in the View group.
3. Click **Tracking Gantt**.

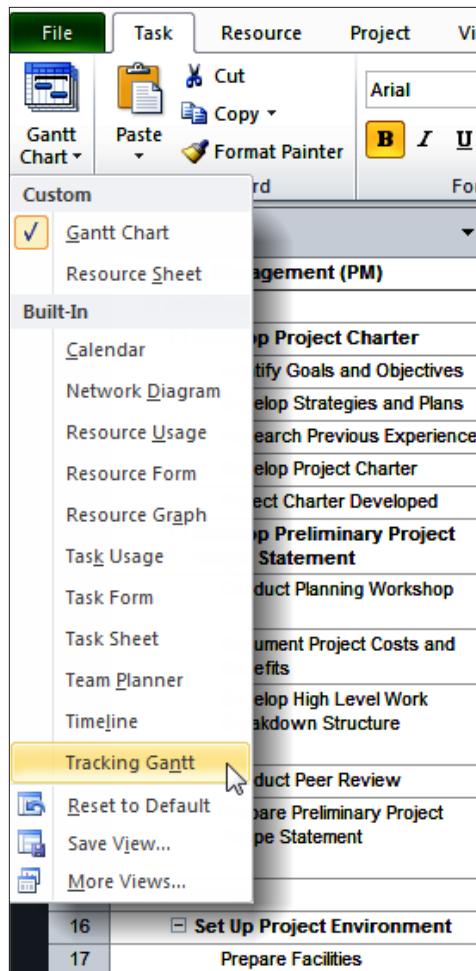

Figure 11-5 Gantt Chart Menu – Tracking Gantt Option

This view uses the default Baseline fields. To display an alternate baseline such as Baseline1, the view will need to be customized.

Marking a Task by Percent Complete

This is the simplest task update method, but it is based on the assumption that you are able to determine what percent complete a task is and that the task is going according to schedule.

If you use this method, it is suggested that general benchmarks be established for what is meant by certain percent complete levels. For example, 25% complete means that work has actually started on the task. This will help avoid confusion and falling behind on tasks.

To update a task by percent complete:

1. Select the desired task(s).
2. Click the **Task** tab.
3. Click **Gantt Chart** in the View group (optional).
4. Click the desired percentage button in the Schedule group.

Figure 11-6 Project Ribbon – Schedule Group – Percent Complete

This method may be useful to quickly update a large portion of the schedule and then you can go back and individually modify tasks that did not go according to schedule. Zero percent (0%) will essentially reset the task to incomplete.

Marking a Task on Track

Instead of choosing the percent complete, this method figures out the percent complete for you by marking the task complete to the status date (e.g., if the task should be done by the status date, the task will be marked 100% complete), but if only a portion of the task should be done by the status date, the percent complete will be calculated.

To mark a task on track:

1. Select the desired task(s).
2. Click **Mark on Track** in the Schedule group.

Figure 11-7 Project Ribbon – Schedule Group – Mark on Track

Updating a Task That is Not on Schedule

When a task is not progressing as scheduled, you typically have information about what is occurring, such as a delayed start date, or an extended remaining duration. This method allows you to fill in the information you do have and remaining pieces will automatically calculate. For example, if you enter an actual Finish Date, Project will automatically record the task as 100% complete. If you enter 2 days of actual duration on a 5 day task, Project will automatically reduce remaining duration to 3 days.

To update a task that is not progressing according to schedule:

1. Select the desired task(s).
2. Click the drop-down arrow on **Mark on Track** in the Schedule group.
3. Click **Update Tasks**.
4. Choose or type the desired updates.
5. Click **OK**.

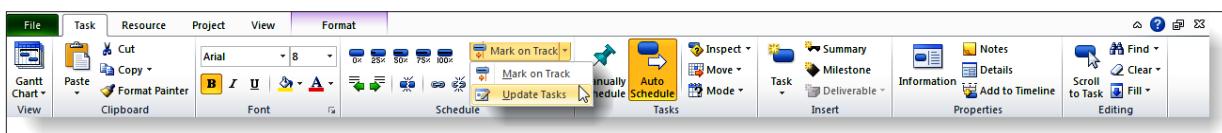

Figure 11-8 Project Ribbon – Schedule Group – Update Tasks

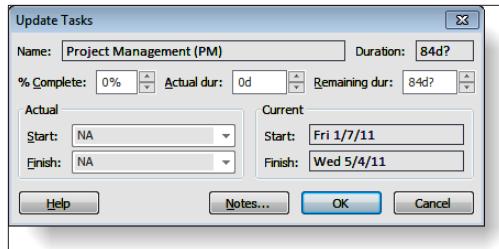

Figure 11-9 Update Tasks Dialog Box

Suggestions:

- If the task has not started, but the duration is now going to take more or less time, simply adjust **Remaining dur**.
- If the task has started, but not on the planned date, enter the **Actual Start**.
- If the task is in progress, but the total duration is incorrect, enter both **Actual dur** and **Remaining dur**.
- If the task finished on a different date, simply enter **Actual Finish**. This will trigger 100 to be assigned to % Complete.

Although you can use this feature for multiple task updates, all the fields in the Update Tasks dialog box will display blank. Update tasks individually if you wish to see the current information about the task such as duration, and remaining duration.

Include notes to record the circumstances behind the update. Notes are also a great way to document your schedule for others to review.

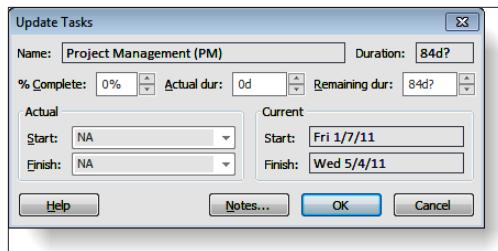

Figure 11-10 Update Tasks Dialog Box – Notes

Rescheduling/Moving a Task

If you have not turned on calculation options as described later in this chapter to automatically move a task, you may need to do that manually to adjust the bars in the Tracking Gantt view so only uncompleted work is shown in the future. When a task is moved, it can be moved either forward or backward.

To reschedule/move a task:

1. Select the desired task(s).
2. Click the **Task** tab.
3. Click the drop-down arrow on Move in the Tasks group.
4. Click the desired option.

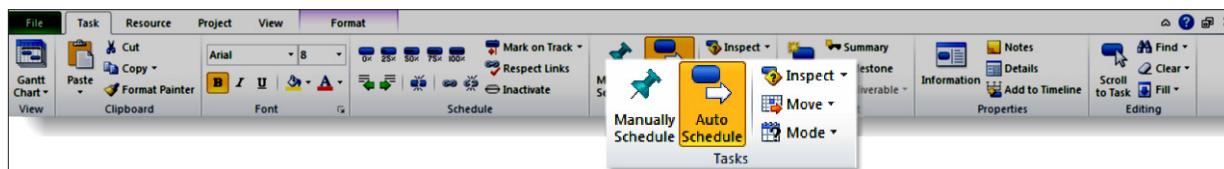

Figure 11-11 Project Ribbon – Task Group – Move

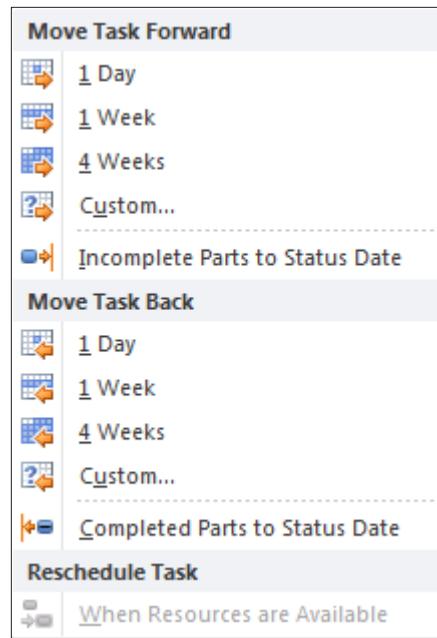

Figure 11-12 Move Task Menu

Moving a task forward or backward puts a constraint on the task in its new location. Rescheduling a task postpones a task until resources are available, but does not put a constraint on the task.

Chapter 12

Printing and Reporting

Printing

Most of the print settings in Project 2013 are similar to other Microsoft Office products. Unique to Project 2013 is the ability to include project and task data in report titles using the header and footer options. Printing Gantt charts on paper or using Gantt charts in presentations will also be discussed in this lesson.

In this lesson, we will discuss:

- Print Settings
- Define Page Setup
- Copy Picture

Print Settings

Project 2013 gives you the ability to customize how a report will be printed. Seeing the final report before it is printed assures the user that they are printing the correct report. Print options allow the user to select a printer and fine-tune which data will be printed. When the print options are selected, the current active project view will be printed.

To display print settings options view:

- File → Print

To close print settings options view:

- Click any tab above the ribbon bar

Below is a view of the print option screen. When the options were selected, the Gantt Chart was the active view. On the left side of the view, several options are available:

Table 12.1 PLACEHOLDER

Option	Action and result
Print	Sends the report to the selected printer.
Copies	Determines the number of copies that will be printed.
Printer	Clicking the arrow on the right side of the box will open a drop-down menu and display all available printers.
Printer Properties	Clicking on the link will display additional printing properties.

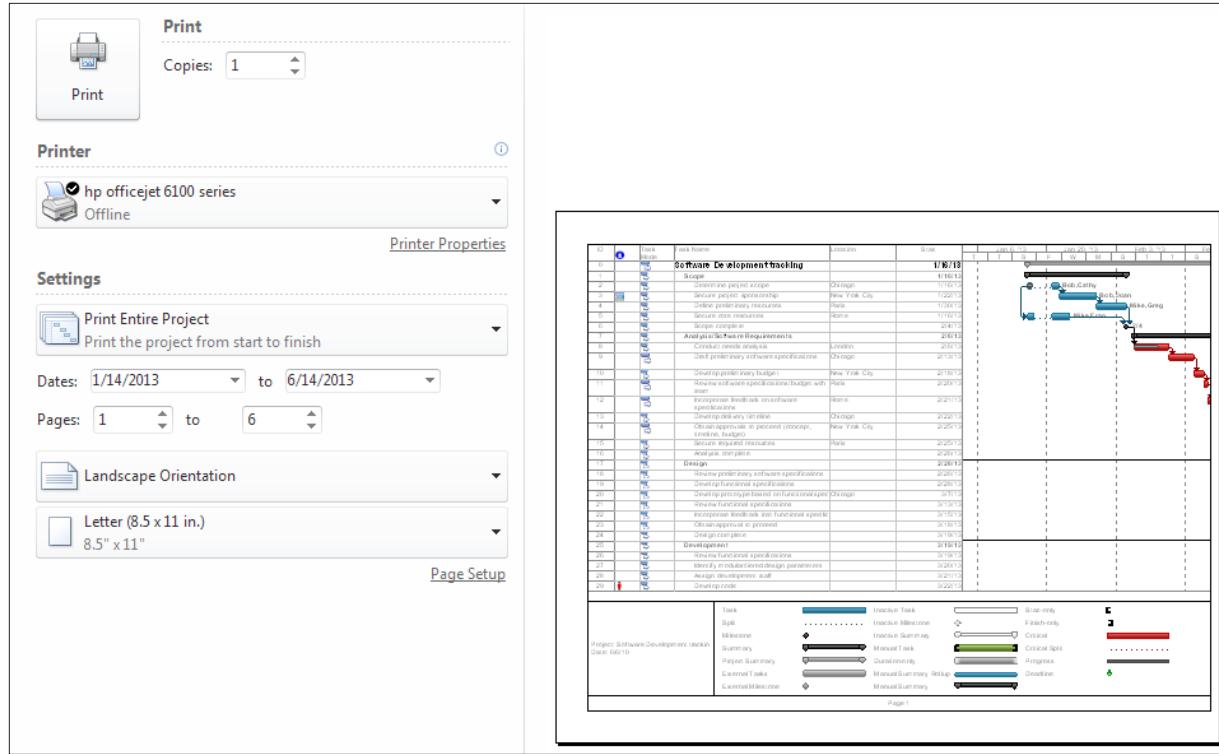

Figure 12-1 PLACEHOLDER

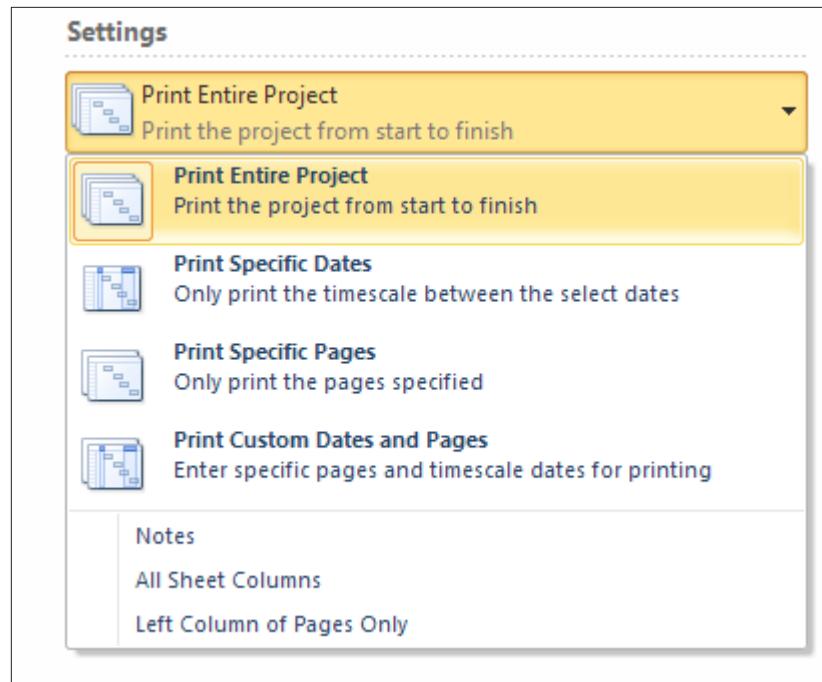

Click the down arrow on Settings to display more options to further refine the final printed report. These options are:

Table 12.2 PLACEHOLDER

Option	Action and result
Print Entire Project	Default value. The entire project schedule will be printed using the current view.
Print Specific Dates	Only the data between the date range will be printed. This option is not available for all reports.

Table 12.2 PLACEHOLDER

Option	Action and result
Print Specific Pages	Select specific page numbers to print.
Print Custom Dates and Pages	Date range and page number range will be printed.
Notes	Add the project notes to the printed report. Notes will be printed on a separate notes page.
All Sheet Columns	When selected, all columns within the current view will print.

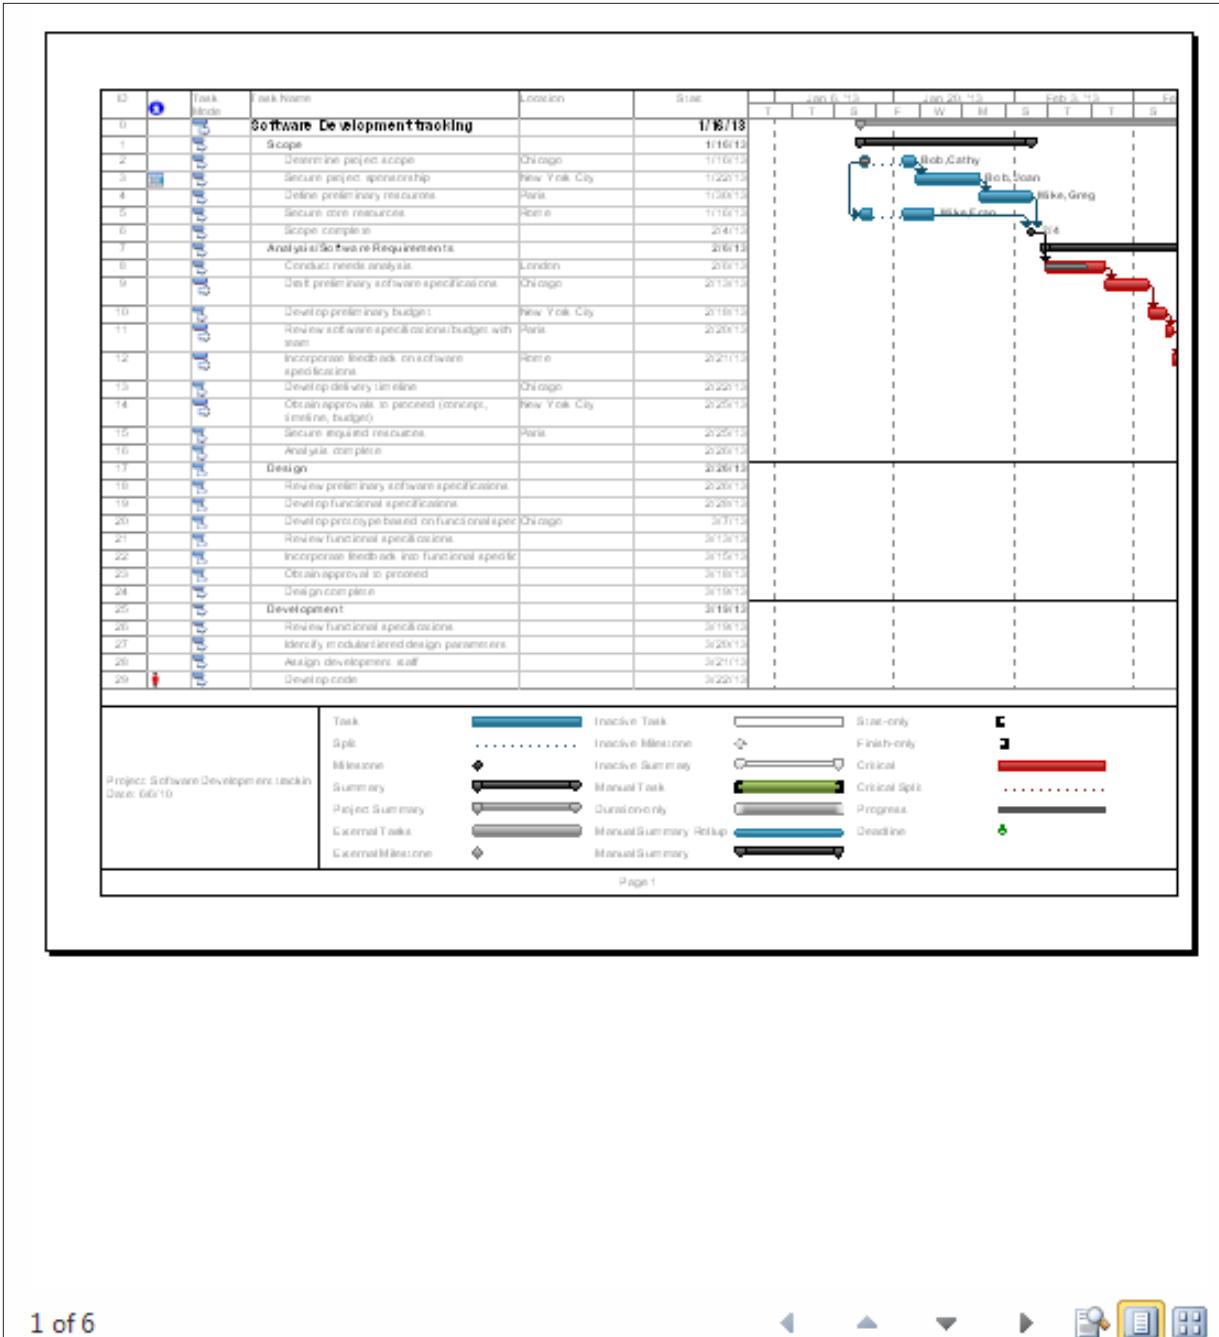

**Figure 12-2** PLACEHOLDER

Page orientation and paper size options are also available.

Viewing options to preview the final report are available by clicking on the buttons below the active project view in the lower right corner of the screen. The buttons are shown below.

Table 12.3 PLACEHOLDER

Button	Represented by	Result
Left arrow	◀	Move one page to the left.
Up arrow	▲	Move one page up.
Down arrow	▼	Move one page down.
Right arrow	▶	Move one page to the right.
Actual size view		Actual size of printed report. Use sliders to see the entire page.
One page		Report will show one page at a time.
Multiple pages		Report will show in multiple page format.

1 of 6

Figure 12-3 PLACEHOLDER

Add the Print Preview button to the Quick Access Toolbar:
Click on the down arrow on the right side of the Quick Access toolbar
Select **Print Preview**

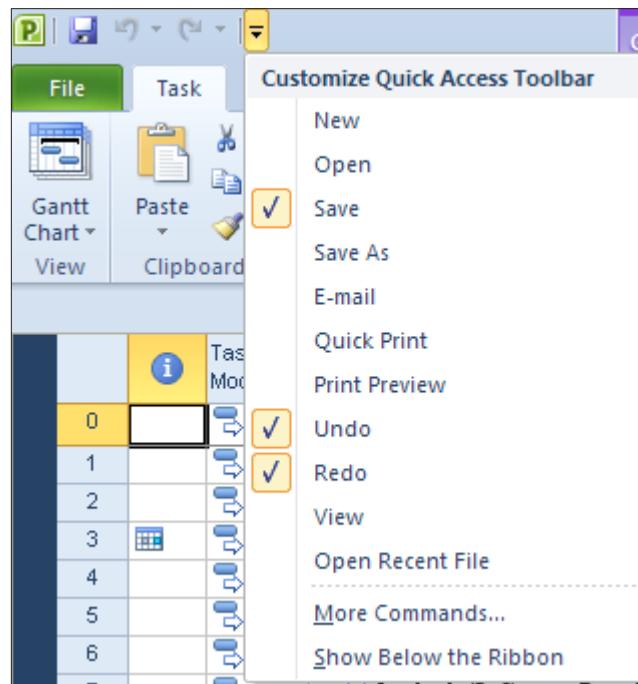

Figure 12-4 PLACEHOLDER

Page Setup: Header, Footer, Note Print Option

Define Page Setup

Page setup options are similar to options available in other Microsoft Office products. Project 2013 has some unique options specifically for the types of views available in the application. These unique options will be discussed in this lesson.

Project level data may be entered for project name, author, company, etc. and applied to the project header and footer information. This information is entered using the Advanced Properties dialog box. Once the data has been entered, the header and footer information is configured per report using the Page Setup options.

To add information in the Advanced Properties dialog box:

- File → Info → Project Information → Advanced Properties

The dialog box is shown below:

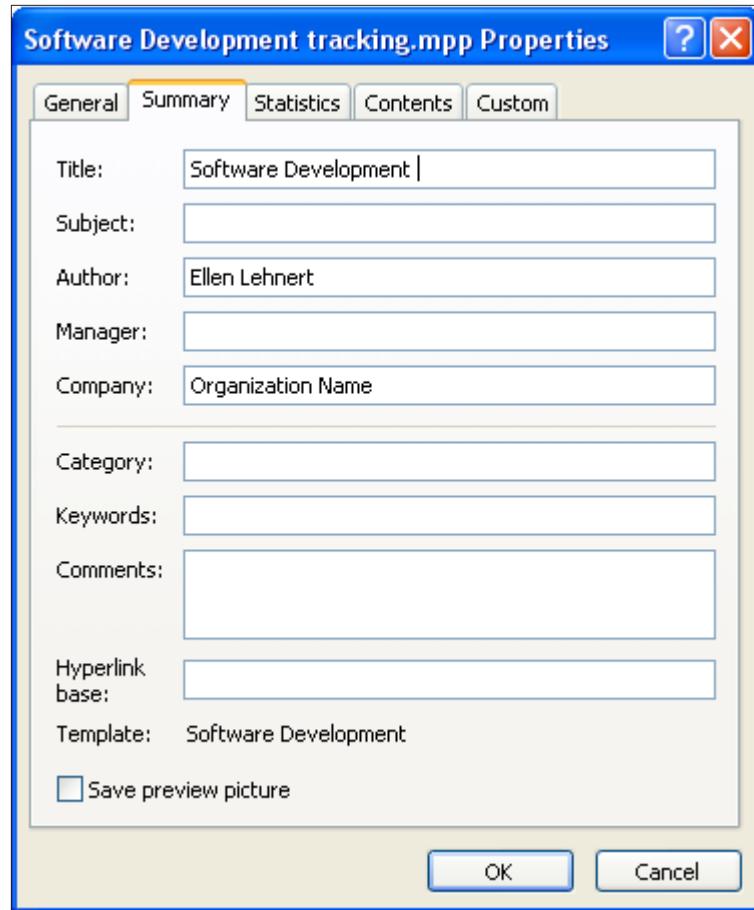

Figure 12-5 PLACEHOLDER

To display the Page Setup dialog box:

- File → Print → Page Setup

A dialog box will appear with the Page tab displayed. The options on this tab are similar to other Microsoft Office applications. The Margin tab contains the margin settings for the current report and an option to print borders around the data. Adjust these values as needed. The Header and Footer tabs allow for configuration of titles and footer information for reports. The view below shows the Header tab used for adding the project title values.

To add Header or Footer information to the title of a project:

- Click the **Header** or **Footer** tab.
- Click on the **Left**, **Center**, or **Right** tab in the lower section of the box.

- Click the down arrow to view the General drop-down menu.
- Select field value.
- Click **Add**.
- Repeat for additional data.

The Header and Footer settings are unique per report and should be checked using Print Preview before each reported is printed.

A current date is not preset to show in either the header or the footer title lines. Add the system's date using the center button above the General drop-down menu.

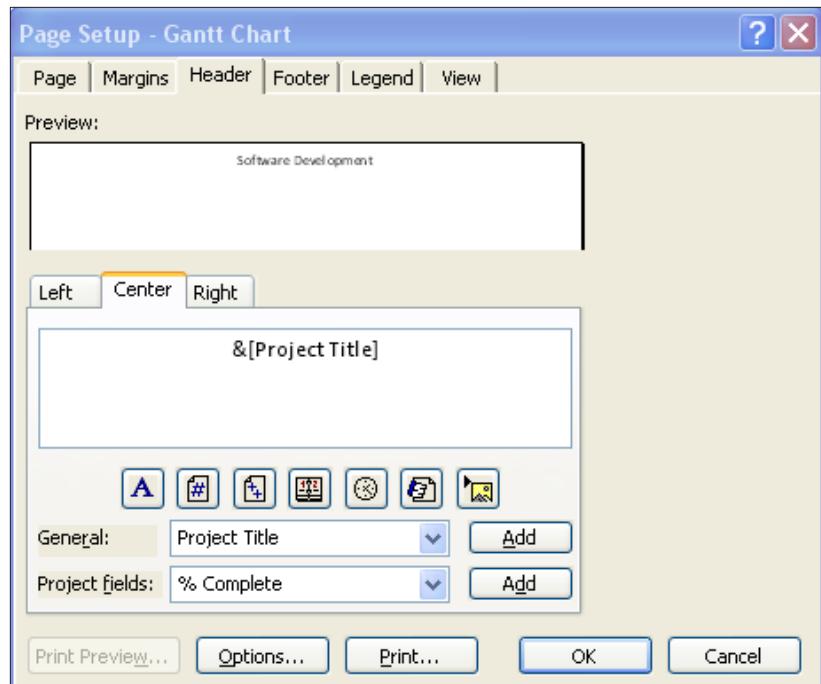

Figure 12-6 PLACEHOLDER

The Legend tab is used to customize or turn off the legend printed on Gantt charts. If unique Gantt chart formatting has been created, the alternate color coding will automatically appear in the legend when the Gantt

chart is printed. The Legend Labels button allows for font color and font selection changes. To disable the legend printed on Gantt charts, select None on the right side of the dialog box .

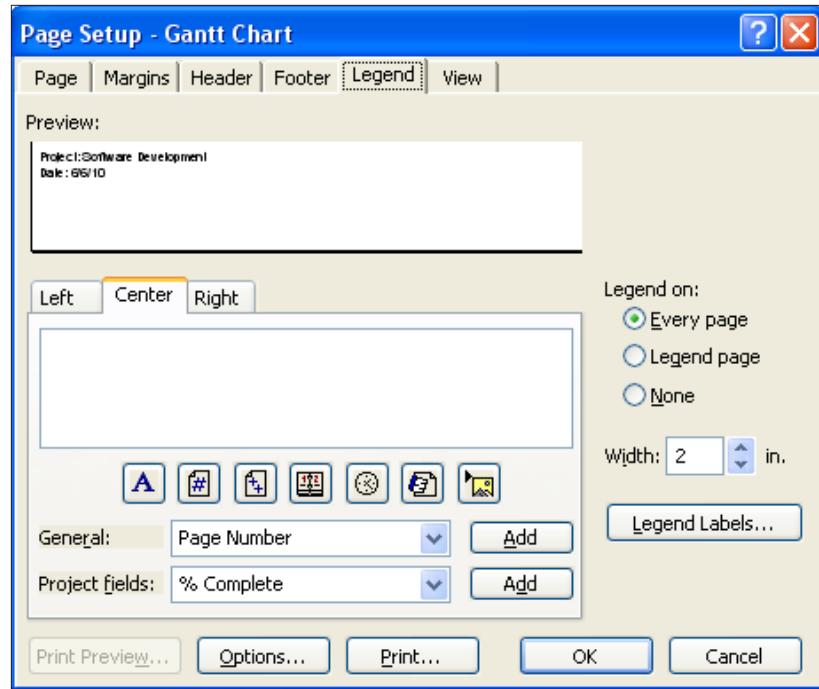

Figure 12-7 PLACEHOLDER

The View tab contains options for specific views, but not all options will be available for each report. The options on the View tab are:

Table 12.4 PLACEHOLDER

Option	Result of selecting option
Print all sheet columns	All columns in the table of the active view will be printed.

Table 12.4 PLACEHOLDER

Option	Result of selecting option
Print first (enter number) columns on all pages	Specify the number of columns to be printed on all pages of the report. When printing a Gantt chart, it is advantageous to add the task name to all pages.
Print notes	A separate notes page will be added to the report. Task ID numbers will be used to tie the note to the task.
Print blank pages	When printing Gantt charts, blank pages might result. Should these pages be printed?
Fit timescale to end of page	Adjusts the timescale for the report.
Print row totals for values within print date range	Adds totals to Resource Usage and Task Usage reports.
Print column totals	Adds totals to Resource Usage and Task Usage reports.

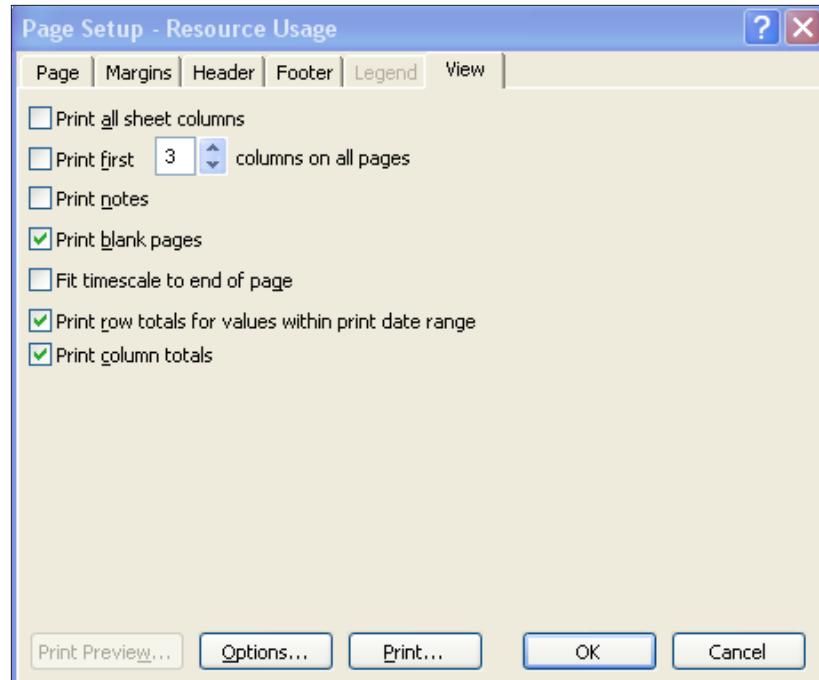

Figure 12-8 PLACEHOLDER

Copy Picture

Use the Copy Picture tool to take a picture of your active view and store it on the clipboard. After it is stored, it can be pasted into Powerpoint, Word, Excel or any other application. The Copy Picture button, by default, is not available on any of the ribbon bars, but it can easily be added to the Quick Access Toolbar.

To add the Copy Picture tool to the Quick Access Toolbar:

- Click the down arrow to the right of the Quick Access Toolbar.
- Select **More Commands**.
- Under Choose commands from Popular commands in the left box select, **Copy Picture**.

- Click **Add**.
- Click **OK** to close.

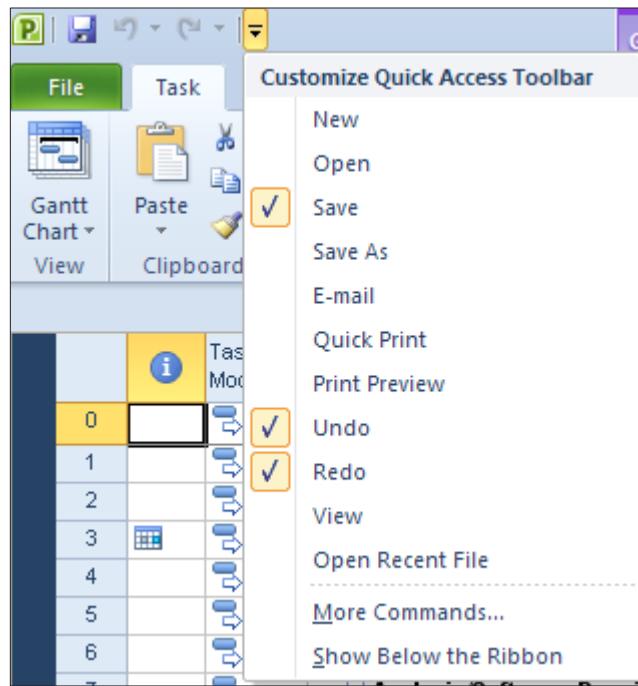

Figure 12-9 PLACEHOLDER

The copy picture icon looks like this:

Figure 12-10 PLACEHOLDER

To use the Copy Picture tool, the view must be displayed and refined for the picture. Navigate to the view to be copied. Some adjustments to a view might include:

- Expand or collapse the work breakdown structure.
- Adjust timescale.
- Adjust titles in the timescale.
- Change formatting.
- Highlight tasks.
- Add drawing elements.

If printing a Gantt chart, adjust the vertical bar in the middle to show the columns to be included and click **Copy Picture** to open the Copy Picture dialog box shown below.

- **Render image** - select image to render For Screen, For Printer or To GIF image file.
- **Copy** - rows on screen or Selected rows.
- **Timescale** - as shown on the screen or date range.
- Click **OK** to copy to the clipboard.

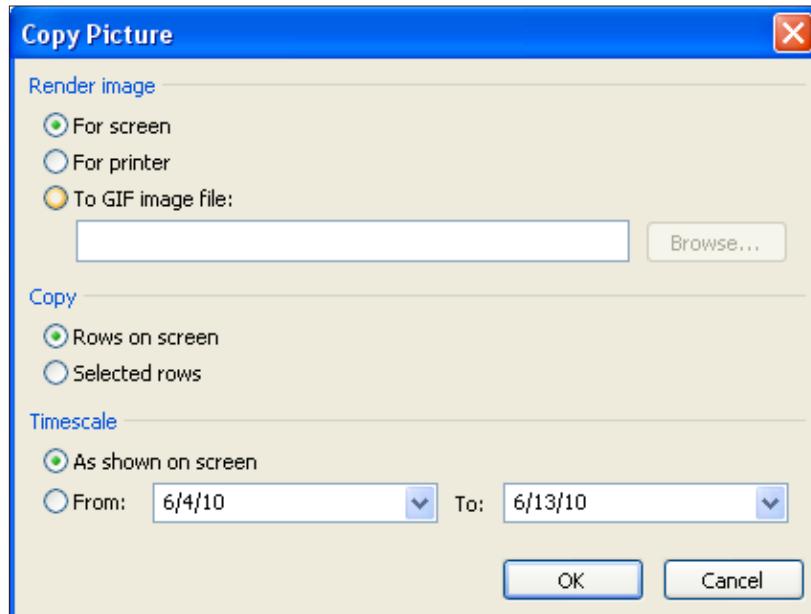

Figure 12-11 PLACEHOLDER

Use the image to paste into a Powerpoint presentation, a Word document, an email or other application. After pasting, resize the image as necessary.

Save as PDF

In Project 2013, we now have the option to save files as PDF's. This can be accomplished in a few different ways. Both ways are accessed via the "backstage" (File Menu).

To save as PDF:

1. In the **File** tab, click **Save & Send**.
2. Select **Create PDF/xPS Document** under the **Save & Send** menu to the right.
3. Select **Create PDF/xPS** under the **Create a PDF/xPS Document** menu to the far right.
4. A browser window will appear asking you to name the file and designate where to store the file. The filetype defaults to "PDF."
5. Once you've named the file and provided the destination location for the file, click **OK**.
6. Project will now ask you to determine what the **Publish Range** is (all dates or a set range of dates) as well as a few items pertaining to the information provided in the PDF file. Select the options desired and click **OK**.

The file will be created and saved. Adobe will not launch the file once it's been created. You can open the PDF from its saved location.

Alternate method to save as PDF:

1. In the **File** tab, click **Save As**.
2. Provide a filename and select **Save as Type** to be **PDF Files (*.pdf)**
3. Project will now ask you to determine what the **Publish Range** is (all dates or a set range of dates) as well as a few items pertaining to the information provided in the PDF file. Select the options desired and click **OK**.

The file will be created and saved. Adobe will not launch the file once it's been created.

The **Save As PDF** function is limited to a single-pane view (i.e. without a split). If you have Gantt Chart with Timeline view displayed, the PDF will generate based on the currently selected (active) pane. This will be either Gantt Chart or Timeline, not both.

Send as an Attachment

Gantt Charts: Timescale, Turn Off Legend, Show the Format Ribbon

Using the Format Tab

The Format tab buttons help you customize the text, columns, colors, and other elements of each type of view. The groups and buttons in the Format tab are different for each type of view. The Format tab is a contextual tab and the content of the tab changes automatically when you change the view.

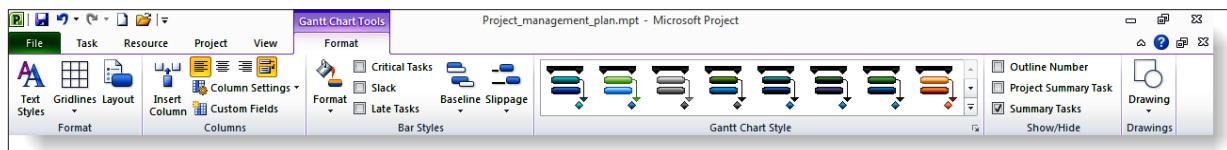

Figure 12-12 Project Ribbon – Gantt Chart Format Tab

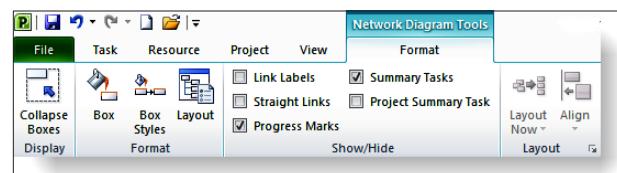

Figure 12-13 Project Ribbon – Network Diagram Format Tab

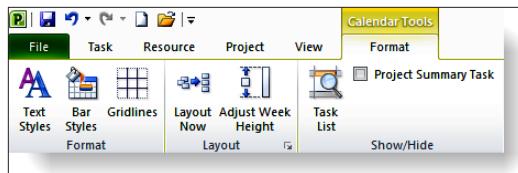

Figure 12-14 Project Ribbon – Calendar Tools Format Tab

You can customize the chart part of these views in Project to better suit your needs. For example, you can change how non-working time is displayed, or you may want to format a Gantt Chart view to quickly identify specific tasks, or perhaps you want to add text to specific bars to help you identify them.

Any changes you make to one Gantt Chart view does not change the look of another Gantt Chart view. For example, if you apply formatting to the Gantt Chart view, this will not carry over to the Detail Gantt view.

Formatting Text Styles

You can use text styles to change the format of text for one cell in a table or apply a unique format to an entire category of information, such as all critical tasks. You may also want to change text to be more readable or to look distinct to garner attention for certain tasks.

You can format the text the same way for any view.

You can't format fonts in the Calendar view, but you can format categories of text, so text will have distinct formatting for items such as all critical tasks or all summary tasks.

Formatting Selected Text

To format selected text:

4. Select the cell containing text that you want to format.
5. In the Ribbon, **Format** tab, **Format** group, click on **Text Styles**.

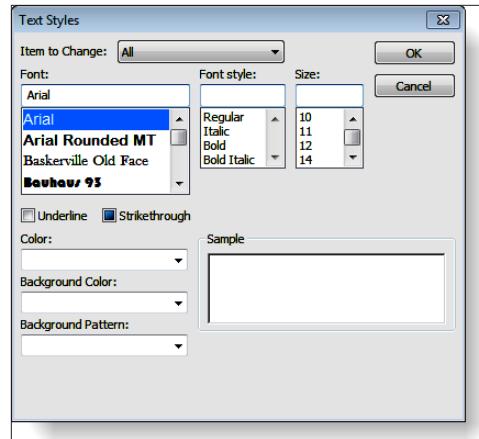

Figure 12-15 Text Styles Dialog

6. From the three lists across the top of the dialog box you can select Font type, Font style and/or the Font Size. You can also select an Underline or Strikethrough check box and set the Font color, Background color and/or choose a Background pattern. A preview of your selection will appear in the sample area.
7. Click **OK** to save changes.

Formatting Categories of Text

To format categories of text:

1. Select the cell containing text that you want to format.
2. In the Ribbon, **Format** tab, **Format** group click on **Text Styles**.
3. Click the dropdown arrow next to **Item to Change**: select a category of text.

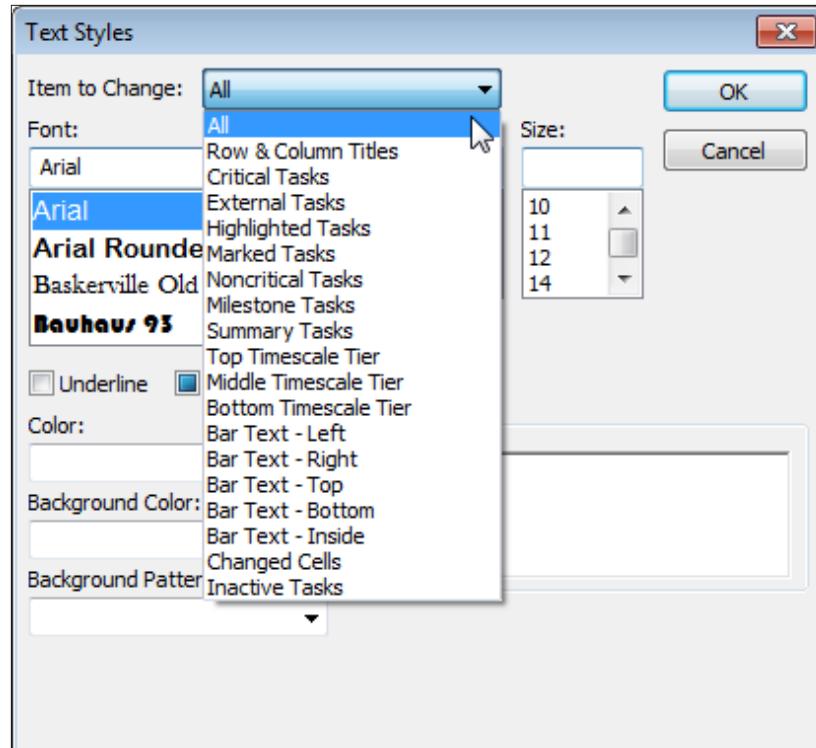

Figure 12-16 Text Styles Dialog with Items to Change Menu

4. Select the settings that you want for the text, including font, font style, font size, color and script.
5. Click **ok** to apply the formatting.

Formatting the Gantt Chart

In addition to text styles you can format the task bars. You can make changes to the shape, color, and pattern, as well as style of the bar.

Changing the Gantt Bars Quickly Using a Style

With a single click, you can apply a pre-defined style to all bars in a Gantt Chart view.

To apply pre-defined styles to Gantt bars:

1. Apply a Gantt Chart view.
2. In the **Format** tab, **Gantt Chart Style** group, click a style in the **Gantt Chart Style** group.

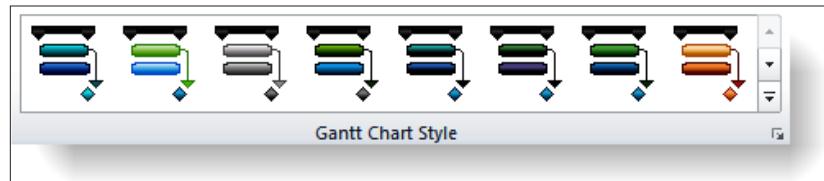

Figure 12-17 Gantt Chart Styles Group

3. The style is instantly applied to all the bars in the view.

Changing the Color, Shape, or Pattern of Gantt Bars

To call attention to task bars on a Gantt Chart view, such as a milestone or summary task, you can change their color, shape, or pattern to separate them from other bars of a particular type.

To format the task bar:

1. Apply a Gantt Chart view.
2. In the **Format** tab **Bar Styles** group, click the **Format** dropdown arrow, and click **Bar Styles**.

You can also double click within the chart portion of a Gantt Chart view, but not on individual bars, to open the Bar Styles dialog box.

3. In the **Name** field, click the type of bar (such as Task or Progress) that you want to format.
4. Click the **Bars** tab.

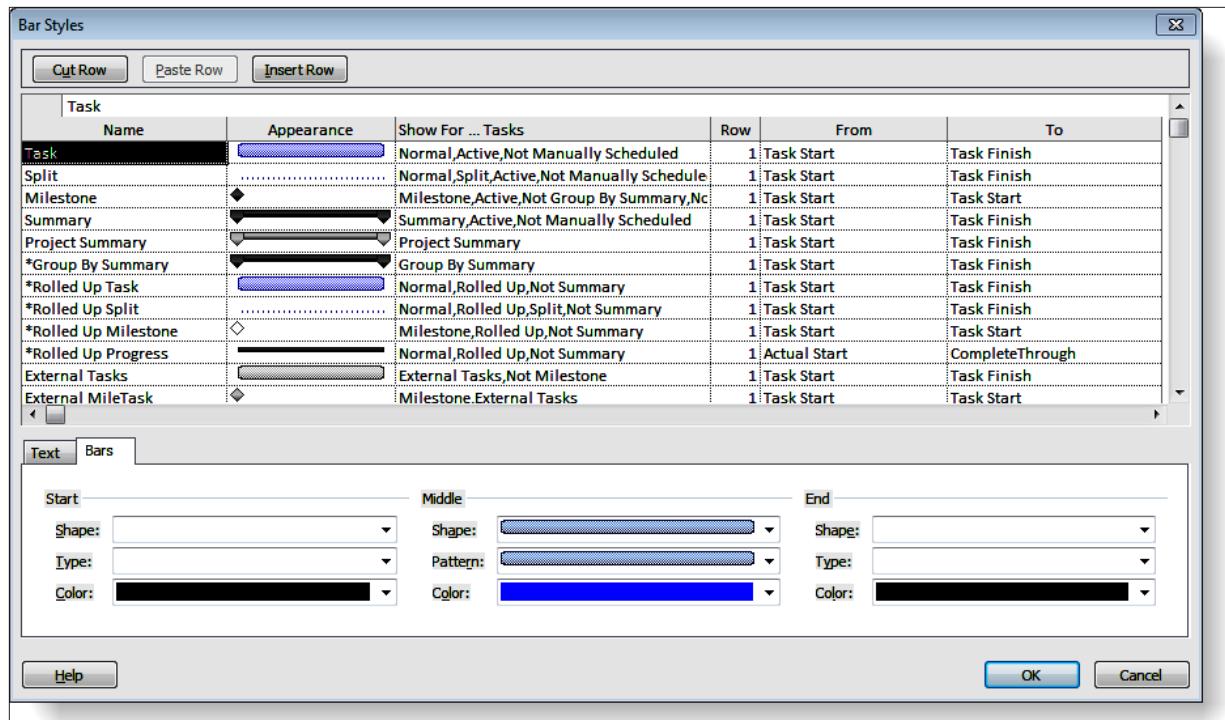

Figure 12-18 Bar Styles Dialog

5. Under Start, Middle, and End, click the shapes, types or patterns, and colors for the bar.

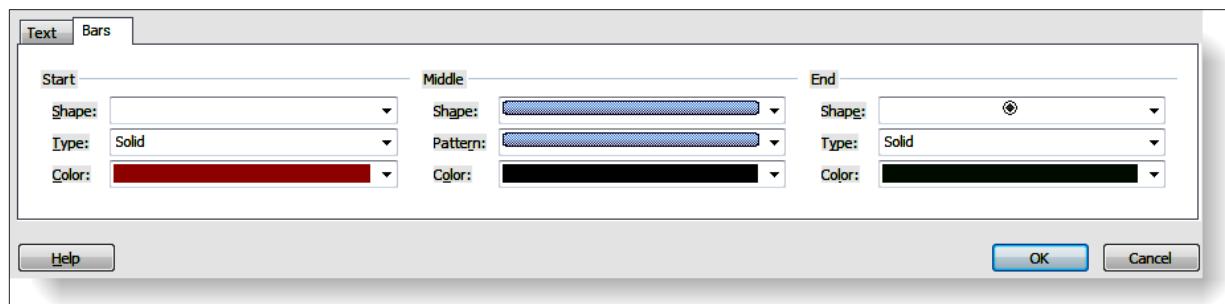

Figure 12-19 Bottom Pane of Bar Styles Dialog – Bars Tab Selected

To highlight a single Gantt bar by changing its formatting, right click on the individual bar and select a fill color.

Creating a New Type of Gantt Bar

If you want to spotlight a particular task category that is not represented by its own Gantt bar, you can create a new Gantt bar style. For example, you can create a type of Gantt bar to show available slack or to call attention to delayed tasks.

To create a new task bar style:

1. Apply a Gantt Chart view.
2. In the **Format** tab, **Bar Styles** group, click the **Format** dropdown arrow, and click **Bar Styles**.

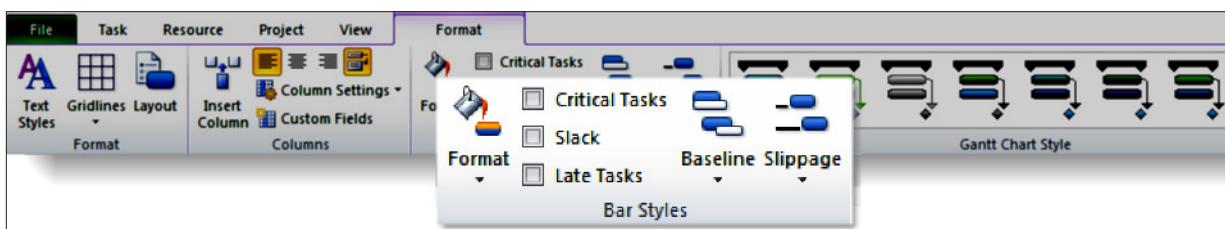

Figure 12-20 Project Ribbon – Format Tab, Bar Styles Group

3. In the **Gantt bar** list, select the row below where you want to insert a new Gantt bar style, and click **Insert Row**.
4. In the **Name** column of the new row, type a name for the new bar style.
5. In the **Show For Tasks** column of the new row, type or select the task type you want the bar to represent.

To display a Gantt bar for tasks of multiple types (such as tasks that are milestones and critical), type a comma (,) after the task category in the text entry box, and type or select a second task category in the **Show For Tasks** field.

6. In the **From** and **To** columns, type or select the fields you want to use to position the start and finish points of the new Gantt bar.

To create a symbol that represents a single date, type or select the same field in the **From** and **To** columns.

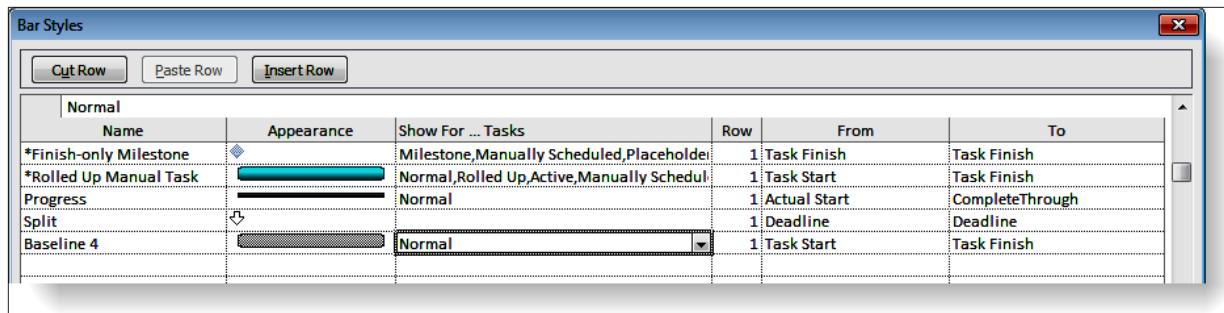

Figure 12-21 Bar Styles Dialog for Create New Gantt Bar

7. Click the **Bars** tab, and under **Start, Middle, and End**, select shapes, patterns or types, and colors for the bar.

To quickly highlight the critical path on the Gantt Chart, in the **Format** tab, **Bar Styles** group, click the check box for **Critical Tasks**. The critical task bars will become red. You can also apply a visual cue showing **Slack** or **Late Tasks** by clicking the appropriate checkbox.

Adding Text to Gantt Bars

Specific project information, such as task names, resource names, completion percentages, and start dates, can be added to bars on a Gantt Chart view.

To add text to task bars:

1. Apply a Gantt Chart view.
2. In the **Format** tab, **Bar Styles** group, click the **Format** dropdown arrow, and click **Bar Styles**.
3. In the table, click the type of Gantt bar (such as Task or Progress) that you want to add text.
4. Click the **Text** tab.
5. In the **Left, Right, Top, Bottom, and Inside** boxes, type or select the field that contains the data you want to display on the Gantt bar.

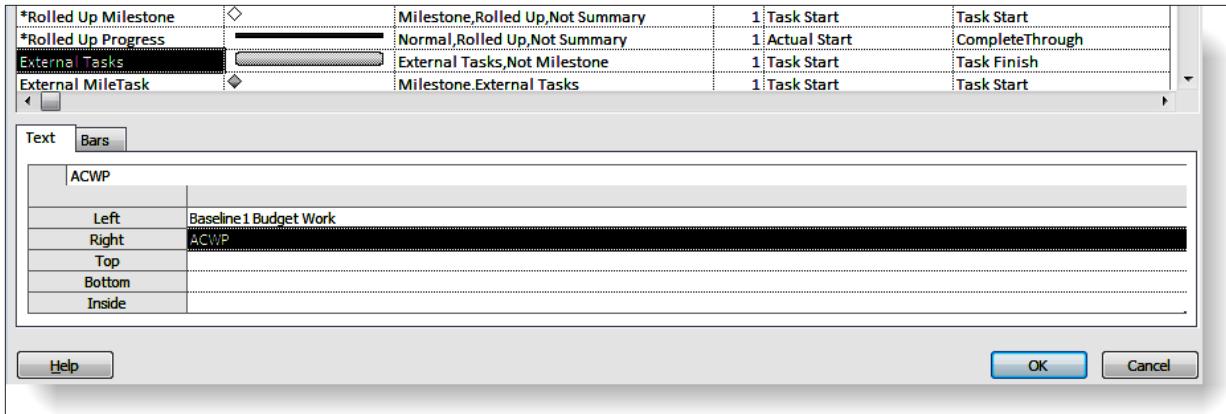

Figure 12-22 Dialog for Adding Text to Gantt Bars

6. To add text that is unique to each task, type or select a custom text field, such as Text1, Text2, or Text3 from the available dropdown list. Text that you enter into these fields from other views is automatically added to the Gantt bars.

Figure 12-23 Link Lines with Descriptions

Changing the Appearance of Link Lines Between Gantt Bars

When you link tasks, Project displays link lines on a Gantt Chart view that show the dependency of the linked tasks.

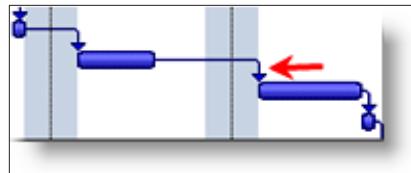

Figure 12-24 Link Line

You can change the way link lines appear or hide the link lines.

To change the appearance of links between Gantt bars:

1. Apply a Gantt Chart view.
2. In the **Format** tab, **Format** group, click **Layout**.

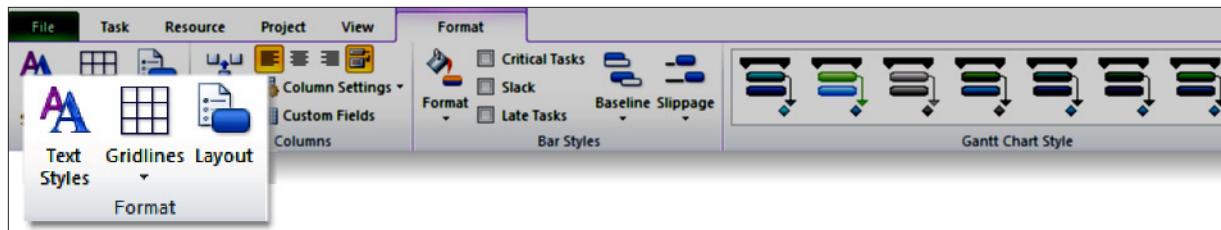

Figure 12-25 Project Ribbon – Format Tab

3. Under **Links**, click the type of link line that you want to use. If you choose the first type of link, then the link lines will not appear.

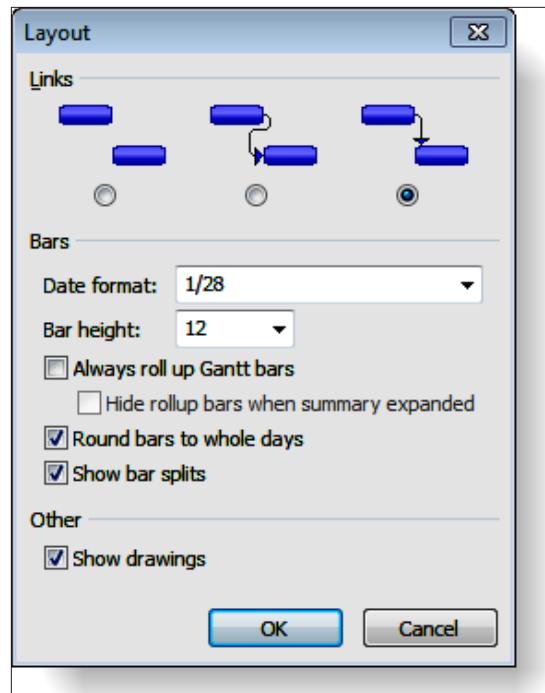

Figure 12-26 Layout Dialog Box

Reporting

Visual Reports

Visual reports are graphical type reports that are available in Project 2013. These reports are defined using a template in Project 2013 and use either a Visio PivotDiagram or Excel PivotTable technology to generate the final report. Once a report is generated, changes and fine-tuning of the report can be performed through Visio or Excel.

Since Visual Reports use Pivot table technology, knowledge of Pivot tables is helpful for the project manager to gain the greatest benefit from these reports.

In this lesson we will discuss:

- Overview of Visual Reports
- The Anatomy of Pivot Tables
- Viewing a Visual Report
- Creating a Visual Report template

Overview of Visual Reports

Visual Reports are reports based on dimensions and measures that produce graphs using Pivot Tables. Pivot Tables will be discussed in the next lesson. When a Visual Report is run, an On-line Analytical Processing (OLAP) cube of data is built based on the metrics stated in the specifications for the Visual Report. After the cube is built, Project 2013 connects to either Visio or Excel to display the report. If an Excel-based report is selected, the report will be based on Pivot Tables. If a Visio-based report is selected, a Visio Pivot Diagram will be produced.

Once a report is generated, it can be manipulated as a Pivot Table and tailored to fit your needs. Types of manipulations include expanding and

contracting outline levels, changing field values, selecting options, adding totals and changing the appearance of graphs. After the Visual Reports are generated, they can be saved or published to a reporting website.

Project 2013 provides multiple Visual Report definition templates found in the Visual Reports - Create Report dialog box. Options are available to filter the Excel templates from the Visio templates. All templates are contained in the All tab within the dialog box.

Sub tabs are provided for various report categories, and contain the following report options:

Table 12.5 Task Summary Tab

Report	Content	Excel or Visio
Critical Tasks status report (Metric)	Work and Work remaining for critical and non-critical tasks.	Visio
Critical Tasks status report (US)	Work and Work remaining for critical and non-critical tasks.	Visio

Table 12.6 Resource Summary Tab

Report	Content	Excel or Visio
Resource remaining work report	Work, Remaining Work, total Work for work resources.	Excel

Table 12.7 Assignment Summary Tab

Report	Content	Excel or Visio
Resource status report (Metric)	Work and Cost values per resource.	Visio

Table 12.7 Assignment Summary Tab

Report	Content	Excel or Visio
Resource status report (US)	Work and Cost values per resource.	Visio
Task status report (Metric)	Work and percent of work completed by WBS level.	Visio
Task status report (US)	Work and percent of work completed by WBS level.	Visio

Table 12.8 Task Usage Tab

Report	Content	Excel or Visio
Cash flow report	Timephased task cost data.	Excel

Table 12.9 Resource Usage Tab

Report	Content	Excel or Visio
Cash flow report (Metric)	Baseline Cost vs Actual Cost over time by resource type.	Visio
Cash flow report (US)	Baseline Cost vs Actual Cost over time by resource type.	Visio
Resource Availability report (Metric)	Total capacity, Work and remaining availability per resource	Visio

Table 12.9 Resource Usage Tab

Report	Content	Excel or Visio
Resource Availability report (US)	Total capacity, Work and remaining availability per resource.	Visio
Resource cost summary report	Resource costs per resource type.	Excel
Resource work availability report	Work and remaining availability over time.	Excel
Resource work summary report	Work, Actual Work and Remaining Availability per resource.	Excel

Table 12.10 Assignment Usage Tab

Report	Content	Excel or Visio
Baseline Cost Report	Compares Baseline Cost, Actual Cost and Cost.	Excel
Baseline Report (Metric)	Baseline, Actual Work and Cost over time.	Visio
Baseline Report (US)	Baseline, Actual Work and Cost over time.	Visio
Baseline Work Report	Baseline Work, Baseline Cost, and Actual Work.	Excel

Table 12.10 Assignment Usage Tab

Report	Content	Excel or Visio
Budget Cost Report	Budget Cost, Baseline Cost, Cost and Actual Cost.	Excel
Budget Work Report	Budget Work, Baseline Work, Work, Actual Work.	Excel
Earned Value Over Time Report	Timephased – Actual Cost of Work performed, baseline values and Earned Value.	Excel

Anatomy of a Pivot Table

To understand Visual Reports, some understanding of Pivot Tables is helpful. Pivot Tables are flexible tables based on measures and dimensions. The information below is an overview of a Pivot Table based report. Additional information regarding Pivot Tables can be found in any Excel reference book, through software Help, or online.

In the table below, sales data from The Chocolate Company shows that sales of different products have occurred in multiple locations. The Chocolate Company also keeps track of the customer type and products sold. We might want to know total sales by customer type, product or location. Pivot Tables have the flexibility to process any of these report requests quickly.

The data below is the source data that will be used to generate the Pivot Table:

Table 12.11 Chocolate Company Sales

Customer	Customer type	Location	Product	Quantity in bars	Price
Customer A	Retail	Chicago	Dark	48	120
Customer B	School	Rome	Milk	24	60
Customer C	Vending	Sydney	White	12	30
Customer D	Retail	Chicago	Dark almonds	36	45
Customer E	School	Rome	Milk almonds	48	120
Customer F	Vending	Sydney	White peanuts	24	60
Customer G	Retail	Chicago	Dark	12	30
Customer H	School	Rome	Milk	36	45
Customer I	Vending	Sydney	White	48	120
Customer J	Retail	Chicago	Dark almonds	24	60
Customer K	School	Rome	Milk almonds	12	30
Customer L	Vending	Sydney	White peanuts	36	45
Customer M	Retail	Chicago	Dark	48	120

In the view below, a Pivot Table has been created using the above data. The data below is consolidated to show sales by Customer type:

Table 12.12 PLACEHOLDER

Customer Type	Sum of Price
Retail	480
School	180
Vending	90
Wholesale	135
Grand Total	885

In the next example, the table was changed to show sales by Location:

Table 12.13 PLACEHOLDER

Location	Sum of Price
Chicago	375
Rome	255
Sydney	255
Grand Total	885

In the next example, sales by Product:

Table 12.14 PLACEHOLDER

Product	Sum of Price
Dark	270

Table 12.14 PLACEHOLDER

Product	Sum of Price
Dark almonds	105
Milk	105
Milk almonds	150
White	150
White peanuts	105
Grand Total	885

Pivot Tables are easily changed to create the type of report necessary for your reporting needs, based on the values contained in the Pivot Table data. Visual Reports will be used to create the Pivot Diagram or Pivot Table but the project manager will need to customize the generated report.

Viewing Visual Reports

Project 2013 comes with built in Visual Report templates to report on cost, work and resource data. Having a specific goal in mind for the type of report you want will help generate more meaningful report data.

To open the Visual Reports – Create Report dialog box:

- Project → Visual Reports
- To create a report:
- Select any report.
- Change timeframe for assignment (usage) data.
- Click **View**.

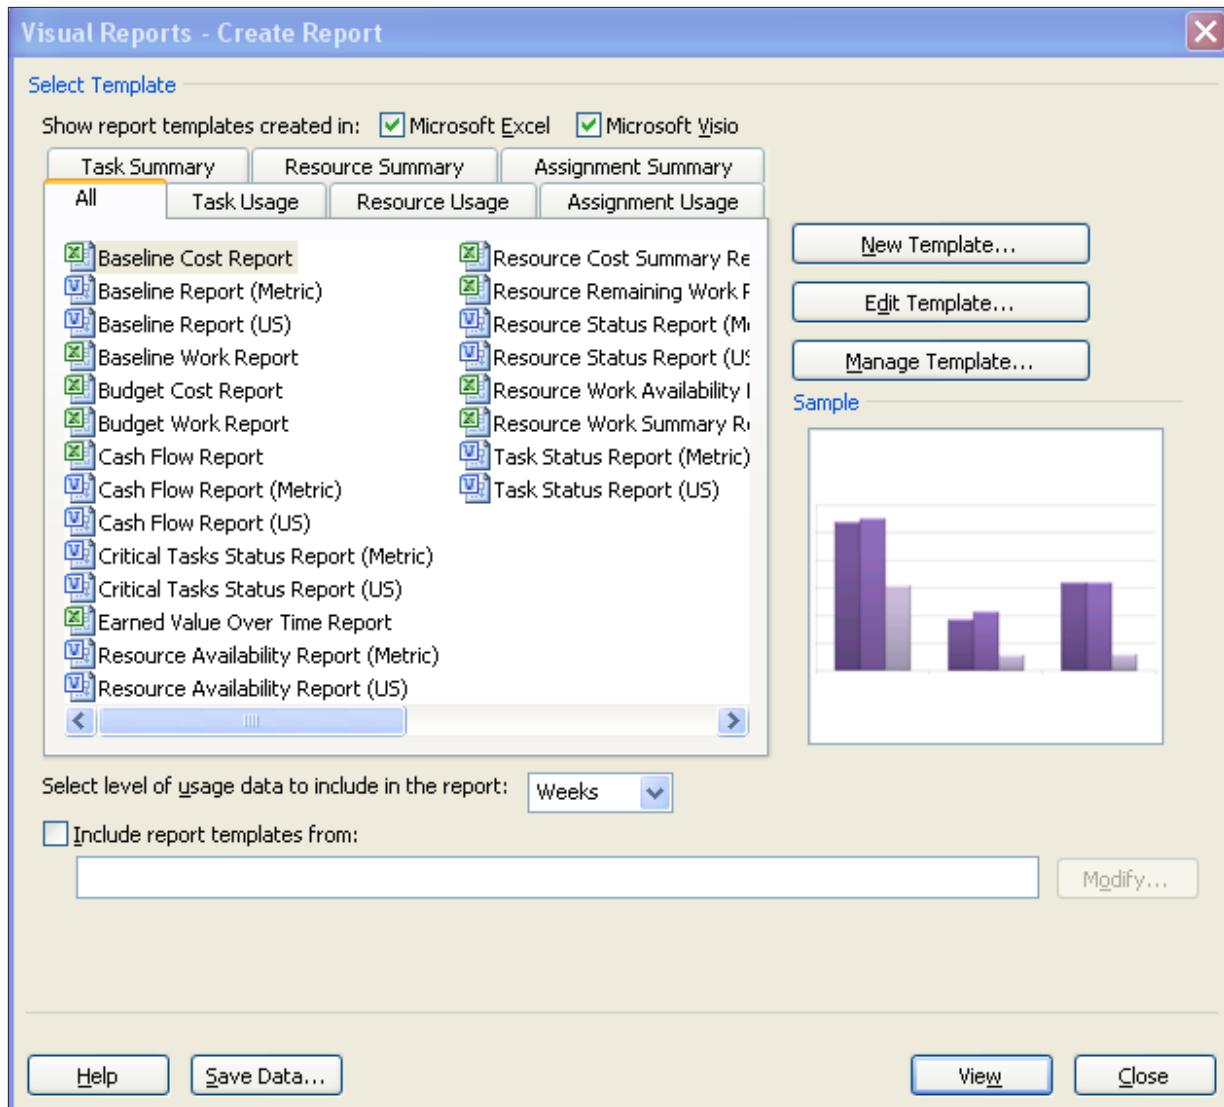

Figure 12-27 PLACEHOLDER

The report will generate by creating an OLAP cube and will open either Visio or Excel. In the generated Pivot Table select the data to be viewed on the report. Notice that the data viewed on the table can also be viewed in chart format.

Options are available for saving the generated OLAP cube or creating an Access database from the data by clicking the Save Data... button.

Dashboard Reports

What are Dashboard Reports?

Dashboard reports are reports that display project data in tabular and graphic form. Each report displays different data and can be customized to tailor the reports for each user's needs.

Below is a view of the Overallocated Resources Dashboard Report. Note that there are two charts each representing different resource data. The chart on the left represents Actual Work v Remaining Work. The chart on the right is displaying resources that are Overallocated at the day level. Each of these reports may be altered to adjust the chart type, chart elements and details of the display data.

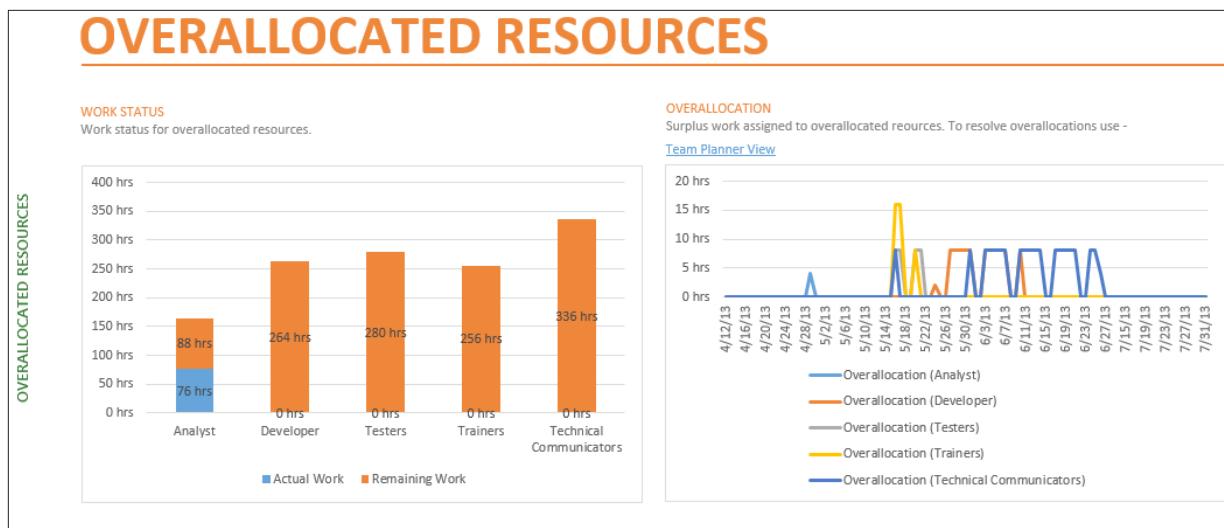

Figure 12-28 PLACEHOLDER

Data included in the Dashboard Reports

Dashboard Reports contain data relating to project progress, variance calculations, and critical path. Below are listed some of the data which are included in the reports. If you are not using the data needed to populate the reports, the reports will not display properly.

Some of the data needed for the reports includes the following project data values:

- Task Duration, Cost and Work.
- Resource Cost and Work.
- Baseline comparison.
- Status date.
- Status field: Late, On Time, Future

To Display a Dashboard Report:

1. Click on the **Reports** tab
2. Click on a Report Category: **Dashboards, Resources, Costs, In Progress**
3. Click on a Report to display

To change parameter values displayed on a Dashboard Report:

1. Click on the **Reports** tab
2. Click on a Report Category: **Dashboards, Resources, Costs, In Progress**
3. Click on a Report to display
4. Click inside of a graph. Options will appear on the right side of the view.
5. Change options as necessary. Close by options by clicking on the X in the upper left corner of the options box.
6. Other changes may be made by clicking on formatting changes on the Design ribbon which will appear when a Report is selected.

Changes to Dashboard Reports will be remembered within the file and will appear the next time the report is viewed.

Clicking on the **Page Breaks** button will display the page breaks as for printing the report. The separate report graphics and tables may be dragged to different pages for printing purposes.

Timeline View Report

Customizing Timeline Views

The Timeline view is new view to Project 2013. The purpose of the Timeline view is to display project tasks using a timeline format and export the view to other applications such as Word, Excel, Outlook and Powerpoint.

Gantt Chart with Timeline is the default view in Project 2013. This view is a split screen with the Timeline view on the top and the Gantt Chart View on the bottom.

To turn Timeline view off/on:

- Task → Gantt Chart
- View → Timeline

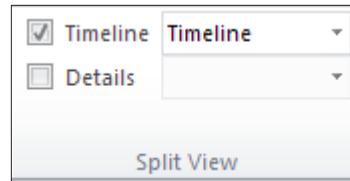

Figure 12-29 PLACEHOLDER

Below is a view of the default Timeline view. The Timeline view is showing the information for the project summary task. The length of the timeline represents the duration of the project. There is a timeframe window open in the middle to highlight a specific timeframe:

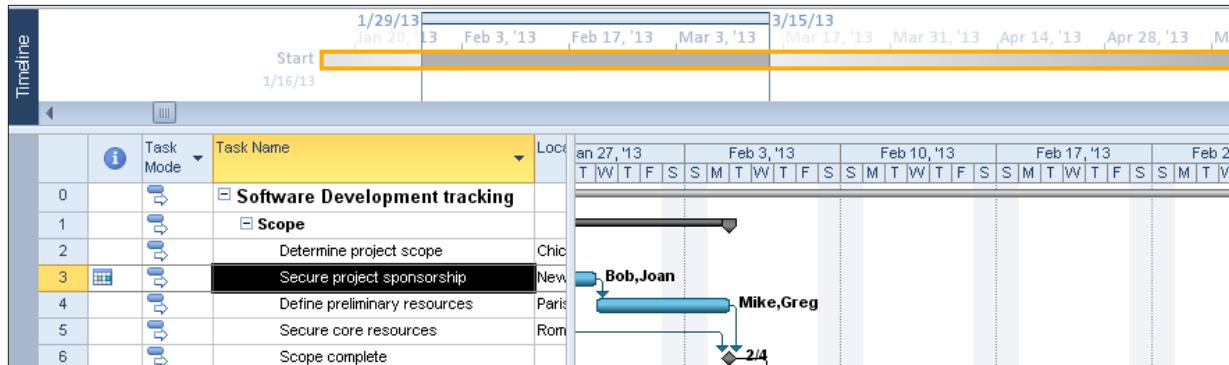

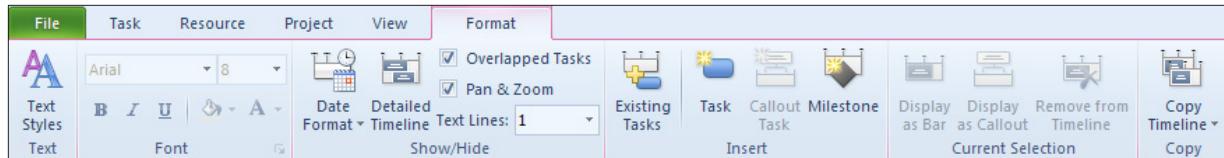

Figure 12-30 PLACEHOLDER

To format or add more data to the Timeline view:

- Click inside the Timeline view window
- Click on the Format tab

Below is a view of the Timeline format bar. Use the buttons on this bar to add additional tasks and format the Timeline view.

Within the Timeline view there is a timeframe window highlighted in the diagram below.

- The Timeframe window may be dragged left and right to emphasize different timeframes of the project schedule. The Gantt bars will adjust as the timeframe window is moved.
- Change the timeframe window by clicking in the timeline view and clicking the zoom slider in the lower right corner of the screen.
- The time density of the Timeline view does not have to match the time density of the Gantt Chart View.
- To turn on and off the Timeframe window, click the Pan & Zoom button on the Format bar.
- Use the Date format button on the Format bar to format the dates in the Timeline view.
- Use the Detailed Timeline button to show task names and dates in the view.

The view below shows the standard Timeline view with the Gantt chart

view below. The Timeframe window is highlighted:

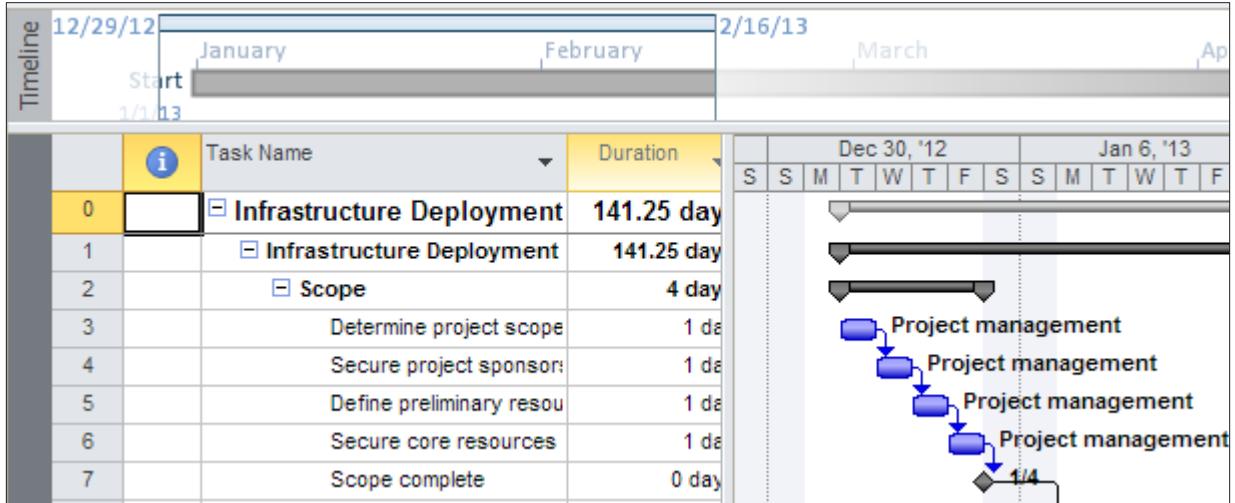

Figure 12-31 PLACEHOLDER

Adding additional tasks to the Timeline view will help build a better picture of your project. Tasks can be individually included to the Timeline view via the Task Information dialog box under the General tab. Double click a task to display the Task Information dialog box.

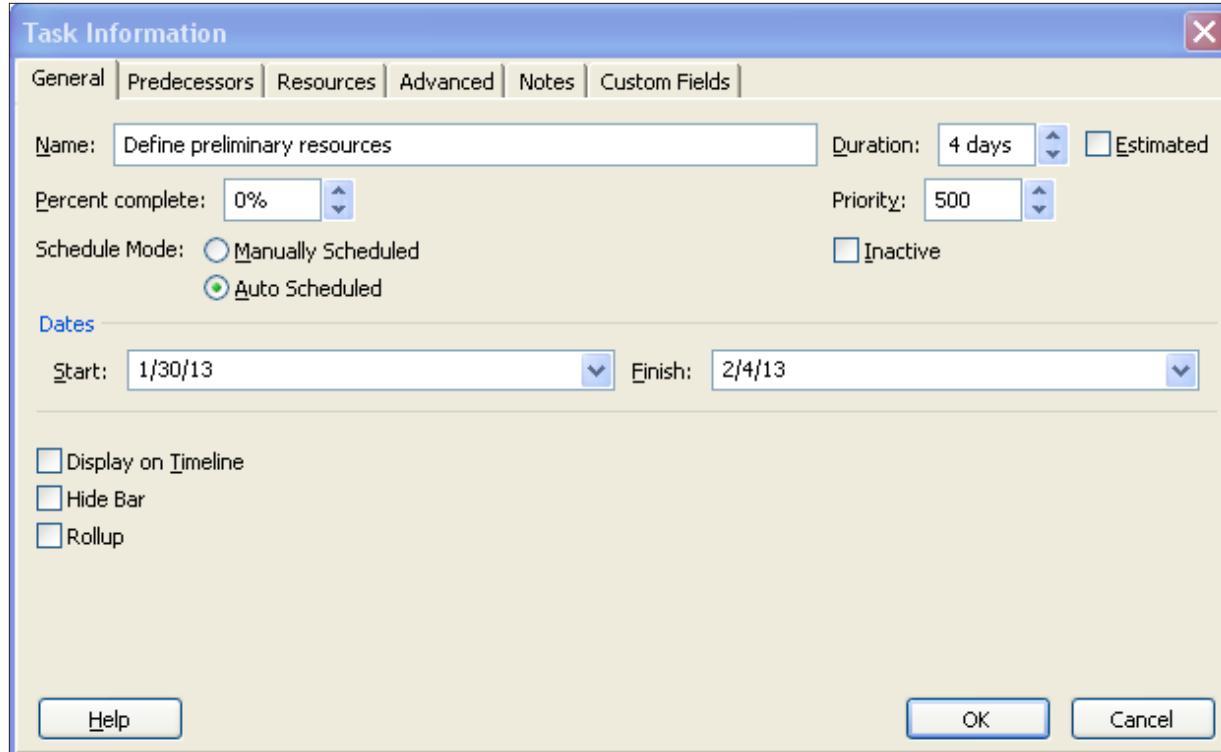

Figure 12-32 PLACEHOLDER

The timeline format bar has several command buttons that will help flag tasks for inclusion into the Timeline view. Clicking the Existing Tasks button will display a list of all tasks for a project where you can scroll through and select the tasks you want displayed in the Timeline view.

To add tasks to the timeline view using the Existing Tasks button:

- Click **Existing Tasks**
- Using the check boxes, select the tasks to add
- Click **OK** to close.

See below for an example of the Existing Tasks choice list. It is easy to tell the difference between summary and detail tasks:

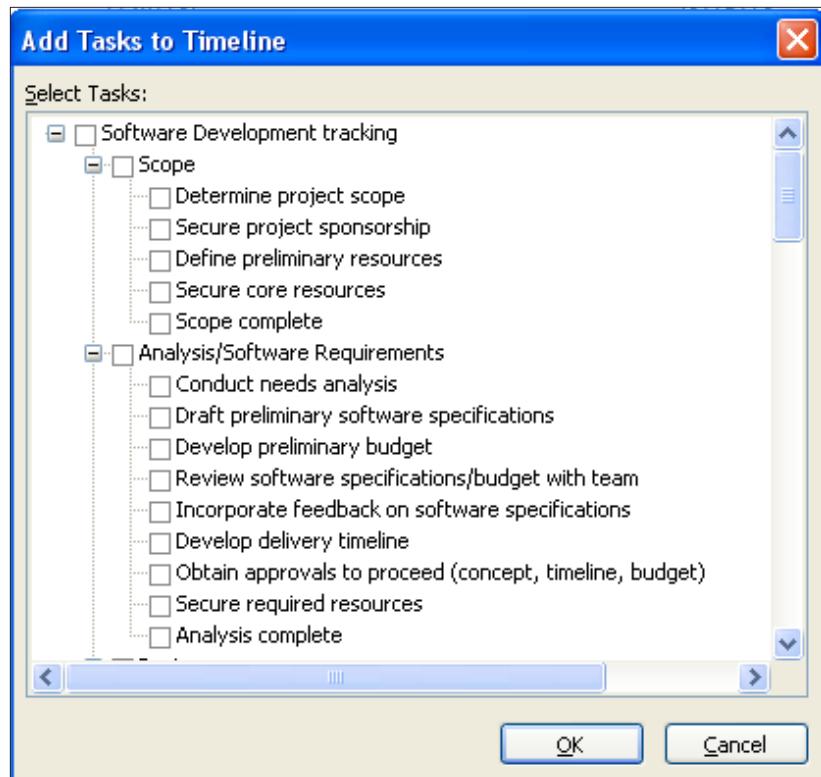

Figure 12-33 PLACEHOLDER

The timeline view should be planned carefully to create a meaningful report. Too much information can confuse the reader. Consider creating a high level tasks report that shows sections of work planned to be completed within timeframes. Below is a view where outline Level 1 tasks have been added to the Timeline view.

To add Outline Level 1 tasks (Summaries) to the Timeline view:

- **Tasks → Gantt Chart**
- **View → Outline → Outline level 1**
- For each summary task to be added to the Timeline view, Select and Right click. Multiple selections maybe made.
- Click **Add to timeline**

The Timeline view below, displays Outline Level 1 Summary tasks only and the Gantt chart displays the same Outline Level 1 Summary tasks.

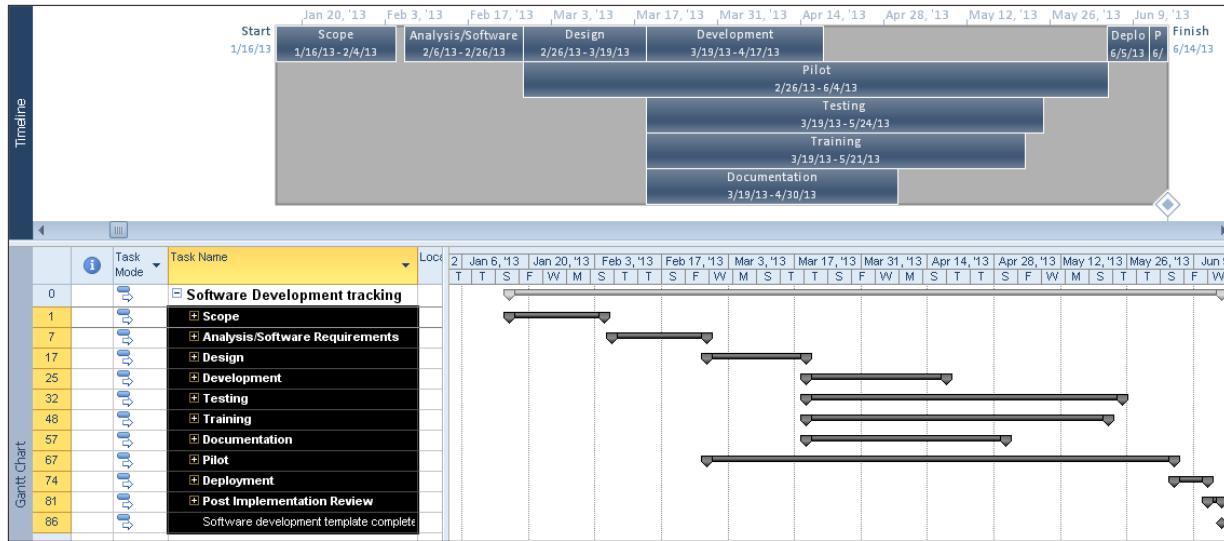

Figure 12-34 PLACEHOLDER

Milestone can also be added to the Timeline view.

To add a milestone to the Timeline view:

- Tasks → Gantt Chart
- View → Filter → Milestone
- Select the milestone tasks and Right click
- Click Add to timeline

The diagram below displays Outline Level 1 tasks with milestones added:

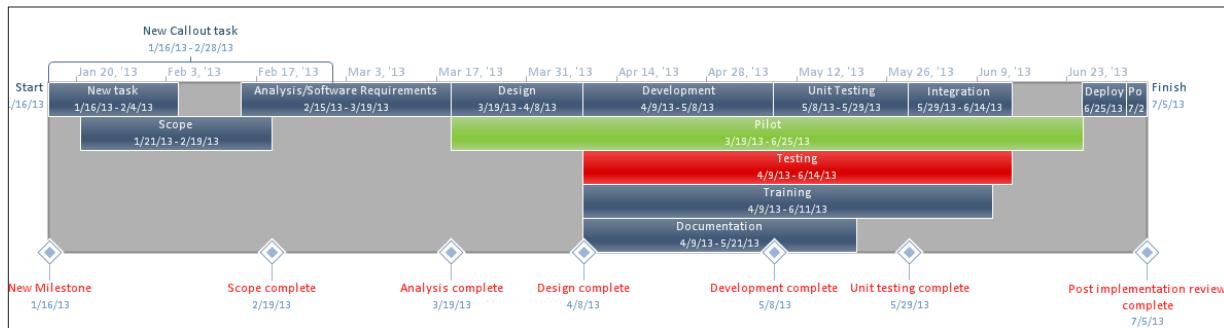

Figure 12-35 PLACEHOLDER

Tasks may be added to the project using the Timeline view format bar. When adding tasks using these buttons, the tasks will be added to the end

of the project schedule and will start on the first day of the project or the current date depending on the scheduling option. The choices are:

- Adding a new task to the timeline
- Adding a new callout task to the timeline
- Adding a new milestone to the timeline

Below is a view showing a new task, a new callout task and a new milestone added to the timeline and the project schedule. The lower half of the view shows the tasks added to the Gantt Chart view. Callout tasks are originally placed above the timeline spanning the timeframe of the task. After they are created, they may be dragged to alternate locations within the Timeline View.

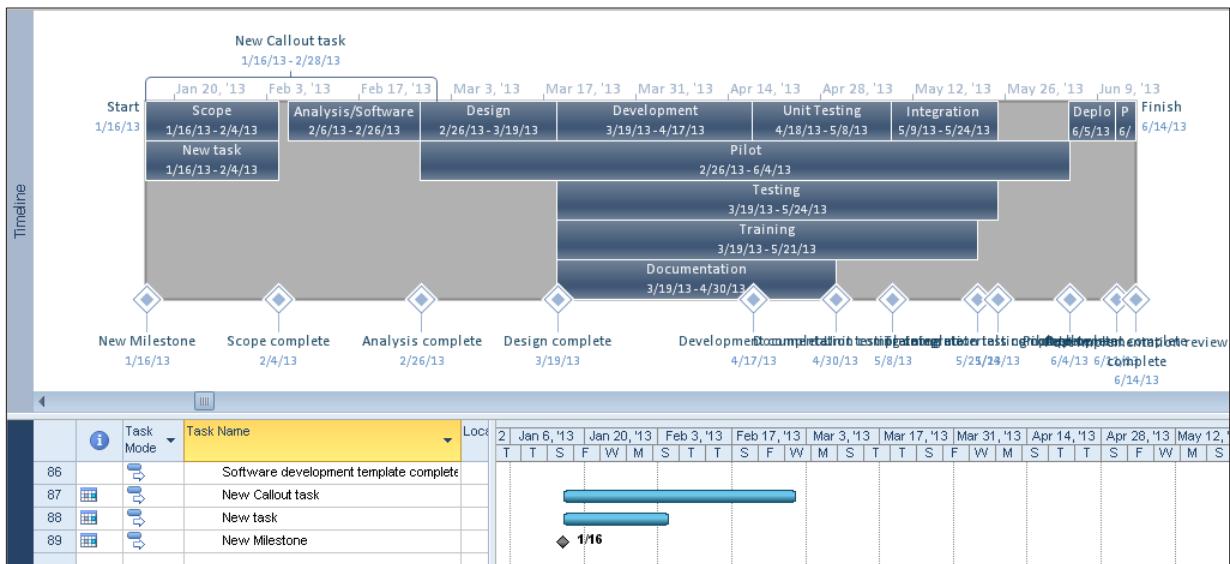

Figure 12-36 PLACEHOLDER

To display an existing task as a callout task:

- Click on a task in the Timeline view
- Click **Display as a Callout**

To display a Callout task as a bar:

- Click on the Callout task
- Click **Display as Bar**

To remove tasks from the Timeline view using the Timeline format bar:

- Click the task in the Timeline view
- Click **Remove from Timeline**

Tasks may be formatted and highlighted as necessary. Text styles and

format buttons are available on the Timeline format bar. Tasks may Change the colors of the timeline bars is helpful when highlighting information.

To export a Timeline view to Outlook, Excel, Word, or Powerpoint to the clipboard:

- Click in the **Timeline** view
- Click **Copy timeline**
- Select copy choice:
 - For email
 - For presentation
 - Full size
- Navigate to destination
- Click **Copy**

Too much information results in a hard to read Timeline view. Select what is important and what will convey your message. The view will become more meaningful and will result in a useful reporting tool.

Exporting Timeline View

As a reminder, Timeline view is great for visual executive summaries. To facilitate sharing information with executives, the Timeline may need to be exported to another application.

To add items to the Timeline, refer to *Customizing Timeline Views* on page 295.

Timeline view must be displayed before you can export it to another application. The simplest method is to click the Timeline checkbox on the View tab. If this option is unavailable, you may need to uncheck the Details checkbox on the same tab.

To copy a timeline:

1. Click inside the Timeline.

2. In the **Timeline Tools, Format** tab, click on **Copy Timeline** and choose the desired option.

- **For e-mail** – Timeline size is reduced to fit into an Outlook message. Small size.
- **For presentation** – Optimized for a PowerPoint presentation. Medium size.
- **Full Size** – Uses the full size of the timeline as displayed in Project. Large size.

You can paste in Outlook to email it to peers or in PowerPoint to format it further.

You can also save the Timeline as an Adobe Acrobat file (see *Save as PDF* on page 271).
